a research project to comparatively evaluate 10 nonlinear optimization algorithms was recently completed a conclusion was that no single optimizer could successfully solve all 40 problems in the test bed even though most optimizers successfully solved at least one third of the problems we realized that improved search directions and step lengths available in the 10 optimizers compared were not likely to alleviate the convergence difficulties for the solution of those difficult problems we have devised an alternative approach called cascade optimization strategy the cascade strategy uses several optimizers one followed by another in a specified sequence to solve a problem a pseudorandom scheme perturbs design variables between the optimizers the cascade strategy has been tested successfully in the design of supersonic and subsonic aircraft configurations and air

breathing engines for high speed civil transport applications these problems could not be successfully solved by an individual optimizer the cascade optimization strategy however generated feasible optimum solutions for both aircraft and engine problems this paper presents the cascade strategy and solutions to a number of these problems
