in recent years there has been tremendous progress in the area of tissue engineering research this book focusses on the fundamental principles underpinning these recent advances in the materials science developed for tissue engineering purposes smart materials for tissue engineering are produced by modifying the physicochemical and biological properties of the scaffolds with response to external stimuli to enhance the tissue regeneration the functions of living cells can be regulated by smart materials which respond to changes in the surrounding microenvironment this book comprehensively documents the recent advancements in smart materials for tissue engineering and will provide an essential text for those working in materials science and materials engineering in academia and industry

an examination of the environmental and economic implications of the computer microchip industry's exodus from California's silicon valley to New Mexico Virginia Ireland and Taiwan in making microchips Jan Mazurek examines the environmental and economic implications of the computer microchip industry's exodus from California's silicon valley to New Mexico Virginia Ireland and Taiwan Globalization economic restructuring and changing manufacturing processes in this rapidly growing industry present difficult new questions for environmental policy Mazurek challenges the

assumptions of US policies designed to promote the competitiveness of domestic microchip makers she argues that although these initiatives focus on the economic effects of environmental regulation they fail to acknowledge how economic and organizational changes within the industry collide with and often confound efforts to monitor and manage pollution from chemicals used in microchip manufacturing despite its reputation as a clean industry microchip manufacturing is fraught with hazards more than sixty dangerous acids solvents caustics and gases are used to make microchips and some of them are suspected to be carcinogens and or reproductive toxins mazurek describes the environmental by products of chipmaking including soil contamination air and water pollution and damage to human health applying insights from economic geography to questions of how and where companies organize production she shows how silicon valley played a pivotal role in the development of the microchip pairing federal environmental data with structural and geographic information on the six firms that continue to build wafer fabrication plants in the united states she demonstrates how reorganization and relocation of manufacturing facilities divert attention from trends in toxic emissions and how they complicate public and private efforts to improve the industry's environmental performance in the concluding chapter mazurek marshals her findings in a broader analysis of the expansion of global manufacturing and the resultant environmental problems

executive overview of semiconductor manufacturing process

this book takes the reader through the actual manufacturing process of making a typical chip from start to finish including a detailed discussion of each step in plain language the evolution of today's technology is added to the story as seen through the eyes of the engineers who solved some of the problems the authors are well suited to that discussion since they are three of those same engineers they have a broad exposure to the industry and its technology that extends all the way back to shockley laboratories the first semiconductor manufacturer in silicon valley the cmos complementary metal oxide semiconductor process flow is the focus of the discussion and is covered in ten chapters the vast majority of chips made today are fabricated using this general method in order to ensure that all readers are comfortable with the vocabulary the first chapter carefully and clearly introduces the science concepts found in later chapters a chapter is devoted to pointing out the differences in other manufacturing methods such as the gallium arsenide technology that produces chips for cell phones in addition a chapter describing the nature of the semiconductor industry from a business perspective is included the entire process of making a chip is surprisingly easy to understand the part of the story that defies belief is the tiny dimensions the conducting wires and other structures on a chip are more than a hundred times thinner than a hair and getting thinner with every new chip design authors are actual engineers who have a broad range of exposure and experience with chip technology contains a unique chapter describing the nature of the semiconductor industry from a business perspective
