the paper investigates classes of adaptive systems used as prediction machines in certain simple games ideally the machine should approach a state which will maximize its expected gain the simplest machine takes the form of an urn similar to the urn models of polya and friedman but modified so as to form an adaptive system

the machine is characterized by learning parameters and a reinforcement scheme the simplest machine is then extended to a machine with 2 to the n th power urns each urn corresponding to one of the possible n tuples of previous moves this machine is further generalized to a machine which begins as a one urn machine and splits states as information is accumulated this machine is capable of growing until it comprises any number of urns many of these machines were simulated on a computer playing against a variety of opponents these results indicate that the prediction is not optimal but is considerably better than random guessing a heuristic value of the limiting state for the one urn machine playing against a probabilistic opponent is obtained and the results of the simulation support this value no convergence proof is available except for restricted values of the parameters α and β author

this book provides an introduction to the elementary theory of logic sets probability theory and linear algebra it treats a number of practical applications useful in everyday life but applicable to biological behavioral and social sciences

the authors 1975 classic gaming simulation has been revised and abridged for this edition three new chapters have been written one on evaluation of games one on their application in policy making and the third on microcomputers in game design it is a comprehensive up to date guide on the multiple uses of gaming and simulation in the social sciences
