this volume contains the complete proceedings of a nato advanced study institute on various aspects of the reliability of electronic and other systems the aim of the institute was to bring together specialists in this subject an important outcome of this conference as many of the delegates have pointed out to me was complementing theoretical concepts and practical applications in both software and hardware the reader will find papers on the mathematical background on reliability problems in establishments where system failure may be hazardous on reliability assessment in mechanical systems and also on life cycle cost models and spares allocation the proceedings contain the texts of all the lectures delivered and also verbatim accounts of panel discussions on subjects chosen from a wide range of important issues in this introduction i will give a short account of each contribution stressing what i feel are the most interesting topics introduced by a lecturer or a panel member to visualise better the extent and structure of the institute i present a tree like diagram showing the subjects which my co directors and i would have wished to include in our deliberations figures 1 and 2 the names of our lecturers appear underlined under suitable headings it can be seen that we have managed to cover most of the issues which seemed important to us vi system effectiveness i performance safety reliability intenance istic lethality hazards support s n r jardine max vel etc

a practical guide to identifying hazards using common hazard analysis techniques many different hazard analysis techniques have been developed over the past forty years however there is only a handful of techniques that safety analysts actually apply in their daily work written by a former president of the system safety society and winner of the boeing achievement and apollo awards for his safety analysis work hazard analysis techniques for system safety explains in detail how to perform the most commonly used hazard analysis techniques employed by the system safety engineering discipline focusing on the twenty two most commonly used hazard analysis methodologies in the system safety discipline author clifton ericson outlines the three components that comprise a hazard and describes how to use these components to recognize a hazard during analysis he then examines each technique in sufficient detail and with numerous illustrations and examples to enable the reader to easily understand and perform the analysis techniques covered include
