a finite difference method is developed to solve the three dimensional steady incompressible potential flow equations obtained by

using a potential function ϕ and two mutually orthogonal stream functions ψ and ψ to describe the flow problems are formulated in an inverse space where the potential function and the two stream functions are the independent variables and the cartesian coordinates x , y and z are the dependent variables the boundaries of the problem in the physical space including the free surface have known positions in the inverse space so trial and error adjustments to the positions of the boundaries are unnecessary methods of describing the effect of the placement of a body whose shape is partially specified in the flow field are developed using finite differences and a solution for the x , y and z coordinates is obtained at each grid point formed by the intersection of surfaces held constant with respect to ϕ , ψ and ψ in the inverse space author

the third symposium on numerical and physical aspects of aerodynamic flows like its immediate predecessor was organized with emphasis on the calculation of flows relevant to aircraft ships and missiles fifty five papers and 20 brief communications were presented at the symposium which was held at the california state university at long beach from 21 to 24 january 1985 a panel discussion was chaired by a m o smith and includeq state ments by t t huang c e lobe l nielsen and c k forester on priorities for future research the first lecture in memory of professor keith stewartson was delivered by j t stuart and is reproduced in this volume together with a selection of the papers presented at the symposium in volume ii of this series papers were selected so as to provide a clear indication of the range of procedures available to represent two dimensional flows their physical foundation and their predictive ability in this volume the emphasis is on three dimensional flows with a section of five papers concerned with unsteady flows and a section of seven papers on three dimensional flows the papers deal mainly with calculation methods and encompass subsonic and transonic attached and separated flows the selec tion has been made so as to fulfill the same purpose for three dimensional flows as did volume ii for two dimensional flows
