several solutions for predicting the movement of meanders have been proposed in the past this report shows these solutions to be unreliable the solution outlined in this report considers soil erodibility as an independent parameter influencing meander migration other conventional parameters such as flow velocity meander radius of curvature river width and others are part of the proposed solution through a combination of well instrumented large scale flume tests quality numerical simulations and fundamental laboratory erosion tests a simple and reliable solution is developed

risk and reliability analysis is an area of growing importance in geotechnical engineering where many variables have to be considered statistics reliability modeling and engineering judgement are employed together to develop risk and decision analyses for civil engineering systems the resulting engineering models are used to make probabilistic predictions which are applied to geotechnical problems reliability statistics in geotechnical engineering comprehensively covers the subject of risk and reliability in both practical and research terms includes extensive use of case studies presents topics not covered elsewhere spatial variability and stochastic properties of geological materials no comparable texts available practicing engineers will find this an essential resource as will graduates in geotechnical engineering programmes
