Not many years ago most discussion of mutation induction by physical and chemical agents concentrated on the initial lesions induced in the DNA with the implicit assumption that once the lesions were made they were converted almost automatically to mutations by relatively simple processes associated with DNA replication. The discovery of a variety of enzymatic processes that can repair these lesions, the great increase in our understanding of the molecular steps involved in repair, replication and recombination, and the increasing availability of cells with genetic defects in these processes have led to the realization that mutation induction is a far more complex process than we originally thought. Repair systems can remove lesions before they can be converted to mutation; they can also convert initial lesions to secondary ones that are themselves mutagenic and they can remove potentially lethal lesions at the expense of making mutations. The error-avoiding systems associated with replication are themselves complex and may be caused to make mistakes in various ways. These different pathways for mutation production and mutation avoidance are still being worked out in prokaryotes and are less well understood in eukaryotes. This symposium shows, however, that very encouraging progress has been made in the last several years and the progress is now accelerating.

Completely reorganized, the new edition presents a significant overhaul of the existing chapters and introduces important new material reflective of the major changes and developments that have occurred in the field over the last decade. As with the first edition, this new volume presents the field within a strong historical framework and all aspects of biological responses to DNA damage are detailed. The book consists of 30 chapters divided into five main parts covering sources and consequences of DNA damage, correcting altered bases in DNA, DNA repair, DNA damage tolerance and mutagenesis, regulatory responses to DNA damage in eukaryotes, and disease states associated with defective biological responses to DNA damage. Basic principles are appropriately stressed; however, the book focuses on the significant progress to date and future research directions.

it has been nearly 35 years since the peacetime biology division of oak ridge national laboratory was started born of rather inauspicious conditions virtually no facilities were available and most of the wartime scientists had left so when we started out it was obvious to me that something had to be done to reestablish research even more because oak ridge was not known at that time for its biological work but rather for the separation of uranium 235 nuclear reactor development and radioisotope production a new tradition had to be promoted although good biological work had been done at oak ridge during the war to protect the workers and the results of this work were quite excellent very few installations remained when we started the work of the biology division it became essential to make it part of the flow of modern biology all over the world as director i had to do more than just attract promising scientists we created an atmosphere conducive to creative research and nurtured all of the other aspects of a productive laboratory of course we carefully prepared the results of our work in publishable form we made a sincere effort to invite seminar speakers and lecturers to come to oak ridge despite the sacrifices this presented to our early budget we also had to do something more and here i cashed in on my experience of the previous 15 years
