just like the industrial society of the last century depended on natural resources today's society depends on information and its exchange. Staab and Stuckenschmidt structured the selected contributions into four parts: part i data storage and access prepares the semantic foundation i.e. data modelling and querying in a flexible and yet scalable manner; these foundations allow for dealing with the organization of information at the individual peers; part ii querying the network considers the routing of queries as well as continuous queries and personalized queries under the conditions of the permanently changing topological structure of a peer-to-peer network; part iii semantic integration deals with the mapping of heterogeneous data representations; finally part iv methodology and systems reports experiences from case studies and sample applications. The overall result is a state-of-the-art description of the potential of semantic and peer-to-peer technologies for information sharing and knowledge management when applied jointly.

The ultimate goal of sustainable tourism is to empower the industry to achieve a harmonious balance between conservation and progress, forging a responsible and resilient tourism sector that caters not only to contemporary travellers but also safeguards the well-being of future generations.

Bringing together diverse perspectives including those of destination managers, policymakers, tour operators, local communities and travellers, sustainable tourism fosters a collective understanding of sustainability in tourism and inspires a shared commitment towards responsible tourism practices.

The Semantic is a vision that has sparked a wide-ranging enthusiasm for a new generation. The Semantic is happening. The central idea of that vision is to make the more understandable to computer programs so that people can make more use of this gigantic asset. The use of metadata (data about data) can clearly indicate the meaning of data so as to provide computers enough information to handle such data in the future. Many additional layers will be required if we want computer programs to handle the semantics of data properly without human intervention. Such layers should deal with the

hierarchical relationships between meanings their similarities and differences logical rules for making new inferences from the existing data and metadata and so on dozens of new technologies have emerged recently to implement these ideas xml extensible markup language forms the foundation of the future rdf resource description framework owl ontology language and many other technologies help to erect a multistory building of the semantic layer by layer by adding new features and new types of metadata according to tim berners lee the inventor of the current and the semantic it may take up to ten years to complete the building the new will be much more complex than the current one and will contain enormous amounts of metadata as well as data
