the first part of this text covers the main graph theoretic topics connectivity trees traversability planarity colouring covering matching digraphs networks matrices of a graph graph theoretic algorithms and matroids these concepts are then applied in the second part to problems in engineering operations research and science as well as to an interesting set of miscellaneous problems thus illustrating their broad applicability every effort has been made to present applications that use not merely the notation and terminology of graph theory but also its actual mathematical results some of the applications such as in molecular evolution facilities layout and traffic network design have never appeared before in book form written at an advanced undergraduate to beginning graduate level this book is suitable for students of mathematics engineering operations research computer science and physical sciences as well as for researchers and practitioners with an interest in graph theoretic modelling

this book provides empirical studies on theoretical issues and outcomes in regards to the integration of innovative technology into language teaching and learning discussing empirical findings and innovative research using software and applications that engage learners and promote successful learning provided by publisher

whether talking about steering a wheelbarrow over rugged terrain or plotting the course of international relations human performance systems involve change sometimes changes are subtle or evolutionary sometimes they are catastrophic or revolutionary and sometimes the changes are from periods of relative calm to periods of vibrant oscillations to periods of chaos as a general rule more complex systems are likely to produce more complex forms of change although social scientists have long acknowledged that change occurs and have considered ways to effect desirable change the dynamical processes of change have been poorly understood in the past this volume combines recent advances in mathematics and experimental design with the best available social science theories to produce a new integrated and compact theory of work organizations and social evolution the domains of application extend from human decision making processes to personnel selection and work motivation work performance under conditions of stress accident and health risk analysis the development of social institutions and economic systems creativity and innovation organizational development and group dynamics and political revolutions and war relative to other literature on nonlinear

dynamical systems theory and this book is unique in that it integrates new developments in it with substantive psychological theory it builds on many recent developments in organizational theory to show that nonlinear dynamics were often implicit in those works all along the result is an entirely new way of viewing social events understanding change processes and asking questions about social systems this book also contains much new empirical work and explains the newly developed methods for testing these new hypotheses

although this book is intended as a sequel to foundations of discrete mathematics by the same author it can be read independently of the latter as the relevant background needed has been reviewed in chapter 1 the subsequent chapters deal with graph theory with applications analysis of algorithms with a detailed study of a few sorting algorithms and a discussion of tractability linear programming with applications variations karmarkars polynomial time algorithm integer and quadratic programming applications of algebra to polya's theory of counting galois theory coding theory of designs a chapter on matroids familiarises the reader with this relatively new branch of discrete mathematics even though some of the topics are relatively advanced an attempt has been made to keep the style elementary so that a sincere student can read the book on his own a large number of comments exercises and references is included to broaden the readers scope of vision a detailed index is provided for easy reference

international business is undergoing continuous transformation as multinational firms and comparative management evolve in the changing global economy to succeed in this challenging environment firms need a well developed capability for sound strategic decisions this comprehensive work provides an applied and integrated strategic framework for developing capabilities that lead to global success it is designed to help readers achieve three essential objectives first it provides intellectual and practical guidelines for readers to execute goals and strategies that lead to meaningful and productive results the book is packed with frameworks cases anchoring exercises techniques and tools to help readers emerge with a completed business plan after the last chapter second it focuses on strategy and how firms build competitive presence and advantages in a global context a primary learning objective is to enable readers to understand and evaluate the major issues in strategy formulation and implementation in a global context third it provides an accessible framework that will help guide readers in making strategic decisions that are sound and effective it offers a unifying process that delineates the necessary steps in analyzing the readiness of a firm to do business abroad in addition to core issues each chapter presents frameworks analytical tools action oriented items and a real world case all designed to provide insights on the challenges imposed by globalization and technology on managers operating in a global context
