this thesis presents a systematic study of the orbital evolution gravitational wave radiation and merger remnant of the black hole neutron star binary merger in full general relativity for the first time numerical relativity simulations are performed using an adaptive mesh refinement code simulator for compact objects in relativistic astrophysics sacra which adopts a wide variety of zero temperature equations of state for the neutron star matter gravitational waves provide us with

quantitative information on the neutron star compactness and equation of state via the cutoff frequency in the spectra if tidal disruption of the neutron star occurs before the binary merges the cutoff frequency will be observed by next generation laser interferometric ground based gravitational wave detectors such as advanced ligo advanced virgo and kagra the author has also determined that the mass of remnant disks are sufficient for the remnant black hole accretion disk to become a progenitor of short hard gamma ray bursts accompanied by tidal disruptions and suggests that overspinning black holes may not be formed after the merger of even an extremely spinning black hole and an irrotational neutron star

it's the ultimate introduction to the world of archery in a book that turns into an actual bow that shoots paper arrows all you have to do is unlock and open the upper and lower bow limbs punch out and fold the arrows and shoot but the book is also a rich and lively illustrated history of archery covering the physics of a bow and arrow the types of bows used since 4500 bc arrows from around the world like the deadly stone arrowheads used by native americans or the japanese whistling kabura ya that helped samurai signal each other here are the great archery battles thermopylae in 480 bc where the spartan 300 faced a persian who shot so many arrows they darkened the sky or the battle of leipzig in 1813 the last battle to feature archers horsemen from the eurasian steppes who helped the russians defeat napoleon

this book develops a rigorous theory of indeterminism as a local and modal concept its crucial insight is that our world contains events or processes with alternative really possible outcomes the theory aims at clarifying what this assumption involves and it does it in two ways first it provides a mathematically rigorous framework for local and modal indeterminism second we support that theory by spelling out the philosophically relevant consequences of this formulation and by showing its fruitful applications in metaphysics to this end we offer a formal analysis of modal correlations and of causation which is applicable in indeterministic and non local contexts as well we also propose a rigorous theory of objective single case probabilities intended to represent degrees of possibility in a third step we link our theory to current physics investigating how local and modal indeterminism relates to issues in the foundations of physics in particular quantum non locality and spatio temporal relativity the book also ventures into the philosophy of time showing how the theory's resources can be used to explicate the dynamic concept of the past present and future based on local indeterminism

this volume is the outcome of a community wide review of the field of dynamics and thermodynamics with nuclear degrees of freedom it presents the achievements and the outstanding open questions in 26 articles collected in six topical sections and written by more than 60 authors all authors are internationally recognized experts in their fields

the foremost observers and theorists discuss the latest developments in the astrophysics of neutron stars black holes and their interaction in the universe often found in compact interacting binaries these objects exhibit broadly similar behaviour the determination of observational signatures that distinguish between these two types of objects is systematically explored supernovae and evolutionary scenarios leading to neutron stars and black holes single or in binaries are also

discussed in detail there is also a discussion of the decades old mystery of cosmic gamma ray bursts currently thought to represent enormous stellar explosions at cosmological distances these could be the result of mergers of a neutron star and its compact binary companion a literal neutron star black hole connection a lucid series of lectures for the advanced graduate student a unifying text that will appeal to the research astrophysicist and space physicist

this book offers review chapters written by invited speakers of the 3rd session of the sant cugat forum on astrophysics gravitational waves astrophysics all chapters have been peer reviewed the book goes beyond normal conference proceedings in that it provides a wide panorama of the astrophysics of gravitational waves and serves as a reference work for researchers in the field

over the last decade astrophysical observations of neutron stars both as isolated and binary sources have paved the way for a deeper understanding of the structure and dynamics of matter beyond nuclear saturation density the mapping between astrophysical observations and models of dense matter based on microscopic dynamics has been poorly investigated so far however the increased accuracy of present and forthcoming observations may be instrumental in resolving the degeneracy between the predictions of different equations of state astrophysical and laboratory probes have the potential to paint to a new coherent picture of nuclear matter and more generally strong interactions over the widest range of densities occurring in the universe this book provides a self contained account of neutron star properties microscopic nuclear dynamics and the recent observational developments in multimessenger astronomy it also discusses the unprecedented possibilities to shed light on long standing and fundamental issues such as the validity of the description of matter in terms of pointlike baryons and leptons and the appearance of deconfined quarks in the high density regime it will be of interest to researchers and advanced phd students working in the fields of astrophysics gravitational physics nuclear physics and particle physics key features reviews state of the art theoretical and experimental developments self contained and cross disciplinary while being devoted to a very lively and fast developing field the book fundamentally addresses methodological issues therefore it will not be subject to fast obsolescence
