Mycosphaerella zeae maydis and *Cochliobolus heterostrophus* are not closely related fungi however both are highly virulent to texas male sterile corn and both produce structurally similar polyketides pm toxin and t toxin respectively the requirement of pm toxin in pathogenesis was confirmed by generating tox sp mutants which lost ability to cause disease sequences within a 23 kb region of the mztox1 locus were compared to those at chtox1 each carries a gene pks1 encoding a polyketide synthase mzpks1 is 59 identical to chpks1 chtox1 also encodes a decarboxylase dec1 required for toxin production while mztox1 carries two reductases red1 red2 along with five transposase like sequences mzpks1 red1 and red2 were shown by gene disruption to be required for pm toxin production and pathogenicity since epidemics caused by these fungi occurred suddenly in 1970 it was expected that the same genes were responsible for toxin production however differences

between the two *tox1* loci argue against recent acquisition of the *pkx1* gene into these two fungi from the same source or from one to the other
