between 2010 and 2012 as part of the communities putting prevention to work cww initiative the centers for disease control and prevention cdc funded 50 states six us territories and 50 communities to support high impact evidence based population wide strategies to create healthy

environments for their residents. CPPW is a locally driven initiative with a primary focus on prevention and control of tobacco use and obesity as part of this initiative. CDC also funded an implementation evaluation to describe and understand how evidence based community level improvements are applied in the field and contribute to improvements in health. We conducted this evaluation using multi case study methods that best captured the local context and implementation processes. Large cross case evaluations present challenges that single or small multi case evaluations do not. These challenges include creating flexible but standard data collection instruments ensuring the feasibility and utility of instruments and processes through pilot testing, promoting consistent data collection and quality, and managing a large qualitative data set and coding team. In this report we document some strategies regarding data collection management and analysis that should be beneficial to other organizations supporting public health initiatives and to investigators in designing the strongest possible evaluations using large multi case design.

Clean hydrogen is a nascent technology that could play an essential role to achieve net zero emissions. However, less than 10 of announced clean hydrogen projects worldwide have reached final investment decision as equity and debt investors often consider these projects to be too risky. This report provides a better understanding of the risk mitigation strategies to unlock and mobilise private capital for clean hydrogen in emerging markets. It highlights how de-risking instruments can address key barriers faced by investors in clean hydrogen projects and suggests ways to allocate risks among actors. The report also proposes actions to enhance international coordination for scaling clean hydrogen financing for development. Furthermore, it draws lessons from case studies showcasing how lighthouse clean hydrogen projects and available economic de-risking and financing instruments are being implemented in a wide array of countries.

The integration of land use and transport planning is key to making cities sustainable and liveable. Accessibility can provide an effective framework for this integration. However, today there is a significant gap between the advances in scientific knowledge on accessibility and its effective application in planning practice. In order to close this gap, Designing Accessibility Instruments introduces a novel methodology for the joint assessment and development of accessibility instruments by researchers and practitioners. The book provides a theoretical and professional analysis of the main concepts behind the definition, use and measurement of accessibility. It undertakes a comprehensive inventory and critical analysis of accessibility instruments, focusing on the bottlenecks in their transposition to planning practice. It introduces and applies a novel methodology for the assessment and improvement of the practical use and usefulness of accessibility instruments. It presents six in-depth illustrative case study applications of the methodology, representing a range of cities with different geographical and institutional settings and different levels of urban and transport planning integration. The book is supported by a companion website, accessibilityplanning.eu, which extrapolates its content to a broader scope and keeps it updated and valid with new iterations of the methodology and further advances on the initial and new case studies.
