this sae recommended practice establishes uniform test procedures and performance requirements for engine coolant type heating systems of enclosed truck cabs the intent is to provide a test that will ensure acceptable comfort for cab occupants it is limited to a test that can be conducted on uniform test equipment in commercially available laboratory facilities there are two options for producing hot coolant in this document testing using these two approaches on the same vehicle will not necessarily provide identical results many vehicle models are offered with optional engines and each engine has varying coolant temperatures and flow rates if the test is being conducted to compare the performance of one heater design to another heater design then the external coolant source approach test a will yield the most comparable results if the test is being conducted to validate the heater installation on a specific vehicle model with a specific engine then using the engine to heat the coolant test b will be more appropriate this document will be reviewed and revised as required with advancements in technology and changes in environmental laws not applicable

an investigation was made to select a cab heating system suitable for maximum operator comfort in air temperatures to 40f and winds up to 15 knots previously design criteria had been based on air temperatures to 65 f but a detailed study of conditions at a typical coastal polar station showed that this extreme was not essential and that a 40 f temperature and 15 knot wind would be an adequate criterion 99 percent of the time tests showed that in temperatures to 40 f with winds to 15 knots a hot water heating system would fmmfortably heat weathertight cabs on equipment which uses liquid cooled engines pro vided the engine coolant was at or near its nor mal operating temperature range during two summer seasons at mcmurdo station hot water heating systems on a variety of construction equipment provided satisfactory cab heating for 80 percent of the operators in tereeratures to 32 f and winds to

25 knots but the slow warm up of the cabs in air temperatures below 10 f was oonable this deficiency may be overcome by controlling engine environments and by pro viding auxiliary circulating pumps for low temperature coolants in service testing is recommended author
