this book constitutes the second volume of interviews with prominent mathematicians and mathematical scientists who visited the institute for mathematical sciences national university of singapore first published in the

institute's newsletter imprints during the period 2010-2020 they offer glimpses of an esoteric universe as viewed and experienced by some of the leading and creative practitioners of the craft of mathematics. The topics covered in this volume are wide ranging running from pure mathematics logic number theory algebraic geometry to applied mathematics mathematical modeling fluid dynamics through probability and statistics mathematical physics theoretical computer science and financial mathematics. This eclectic mix of the abstract and the concrete should interest those who are enthralled by the mystique and power of mathematics whether they are students researchers or the non-specialists. By briefly tracing the paths traveled by the pioneers of different national backgrounds the interviews attempt to put a cultural face to an intellectual endeavor that is often perceived as dry and austere by the uninitiated. They should also interest those who are intrigued by the influence of the environment on the creative spirit and in particular those who are interested in the psychology and history of ideas.

This book serves as a reference text for regulatory industry and academic statisticians and also a handy manual for entry level statisticians. Additionally it aims to stimulate academic interest in the field of nonclinical statistics and promote this as an important discipline in its own right. This text brings together for the first time in a single volume a comprehensive survey of methods important to the nonclinical science areas within the pharmaceutical and biotechnology industries specifically the discovery and translational sciences the safety toxicology sciences and the chemistry manufacturing and controls sciences. Drug discovery and development is a long and costly process. Most decisions in the drug development process are made with incomplete information. The data is rife with uncertainties and hence risky by nature. This is therefore the purview of statistics. As such this book aims to introduce readers to important statistical thinking and its application in these nonclinical areas. The chapters provide as appropriate a scientific background to the topic relevant regulatory guidance current statistical practice and further research directions.

This book based on published studies takes a unique perspective on the 30 year collapse of pharmaceutical industry productivity in the search for small molecule magic bullet interventions. The relentless escalation of inflation adjusted cost per approved medicine in the United States from 200 million in 1950 to 1.2 billion in 2010 has driven industry giants to at best slavish imitation in drug design and at worst abandonment of research and embracing of widespread fraud in consumer

marketing the book adapts formalism across a number of disciplines to the strategy for design of multilevel interventions focusing first on molecular cellular and larger scale examples and then extending the argument to the simplifications provided by the dominant role of social and cultural structures and processes in individual and population patterns of health and illness in place of magic bullets we must now apply magic strategies that act across both the scale and level of organization this book provides an introductory roadmap to the new tools that will be needed for the design of such strategies a

this text takes a novel approach the style is not as dry as other statistics texts and so should not be intimidating even to a relative newcomer to the subject the layout is easy to navigate there are chapter aims summaries and key point boxes throughout the pharmaceutical journal 2008 this text is a clear accessible introduction to the key statistical techniques employed for the analysis of data within this subject area written in a concise and logical manner the book explains why statistics are necessary and discusses the issues that experimentalists need to consider the reader is carefully taken through the whole process from planning an experiment to interpreting the results avoiding unnecessary calculation methodology the most commonly used statistical methods are described in terms of their purpose when they should be used and what they mean once they have been performed numerous examples are provided throughout the text all within a pharmaceutical context with key points highlighted in summary boxes to aid student understanding essential statistics for the pharmaceutical sciences takes a new and innovative approach to statistics with an informal style that will appeal to the reader who finds statistics a challenge this book is an invaluable introduction to statistics for any science student it is an essential text for students taking biomedical or pharmaceutical based science degrees and also a useful guide for researchers

building on its best selling predecessors basic statistics and pharmaceutical statistical applications third edition covers statistical topics most relevant to those in the pharmaceutical industry and pharmacy practice it focuses on the fundamentals required to understand descriptive and inferential statistics for problem solving incorporating new material in virtually every chapter this third edition now provides information on software applications to assist with evaluating data new to the third edition use of excel and minitab for performing statistical analysis discussions of nonprobability sampling procedures determining if data is normally distributed evaluation of covariances and testing for precision
