henry harris here provides an account of how scientists came to understand that the bodies of all living things are composed of microscopic units that we now call cells harris turns to the primary literature the original texts scientific papers and correspondence of medical researchers involved in the formulation of the cell doctrine to reconstruct the events that enabled researchers to comprehend the nature and purpose of cells translating many of these documents into english for the first time harris uncovers a version of events quite different from that described in conventional science textbooks focusing on the scientific history of the genesis of the cell doctrine the author also considers contemporary social and political contexts and shows how these influenced what experiments were undertaken and how the results were represented

this book is a comprehensive multi authored work on the structure and function of the mammalian testis the approach emphasizes gene expression translation and production of specific gene products and the cellular and molecular regulation of these fundamental processes rather than provide a global survey of all aspects of male reproduction this book stresses specific mechanisms that underscore the structure and function of the testis it explains old and new concepts from a cellular and molecular perspective this novel approach allows the authors to forge links between cell and molecular biology and well established aspects of spermatogenesis and steroidogenesis the result is a well focused comprehensive and synthetic analysis of testicular biology
