inhaltsangabe abstract investors should not and in fact do not hold a single asset they hold groups or portfolios of assets an

important aspect in portfolio theory is that the risk of a portfolio is more complex than the risk of its components it depends on how much the assets represented in the portfolio move together that is on the correlation between the single assets in portfolio theory there are several definitions of risk first of all the capital asset pricing model capm relies on the beta factor of an asset relative to the market as a measure for the asset's risk on the other hand also downside risk can be used in order to determine a portfolio's risk the kind of risk in question is market risk which is the risk of losses arising from adverse movements in market prices or rates market risk can be subdivided into interest rate risk equity price risk exchange rate risk and commodity price risk for many investment decisions there is a minimum return that has to be reached in order to meet different criteria returns above this minimum acceptable return ensure that these goals are reached and thus are not considered risky standard deviation captures the risk associated with achieving the mean while downside risk assumes that only those returns that fall below the minimal acceptable return incur risk one has to distinguish between good and bad volatility good volatility is dispersion above the minimal acceptable return the farther above the minimal acceptable return the better it is one way of measuring downside risk is to consider the shortfall probability or chances of falling below the minimal acceptable return another possibility is measuring downside variance i.e. variance of the returns falling below the minimal acceptable return as a consequence downside variance is very sensitive to the estimate of the mean of the return function while standard deviation does not suffer from this problem thus the calculation of downside deviation is more difficult than the calculation of standard deviation the quality of the calculation also depends on the choice of differencing interval of the time series the calculation of downside risk assumes that financial time series follow either a normal or lognormal distribution finally there is no universal risk measure for the many broad categories of risk for example standard deviation captures the risk of not achieving the mean beta captures the risk of investing
