much has been written and debated about the various methodologies applied to modern stratigraphic analysis and the ever increasing complexity of terminologies however there exist numerous stratigraphic techniques that are reliant upon precise quantitative reproducible data rather than qualitative interpretive stratigraphic methodologies such stratigraphic techniques are applied in an entirely pragmatic non biased manner within the petroleum industry to provide enhanced stratigraphic understanding of petroleum systems the petroleum industry is a key driver behind the development of new stratigraphic techniques and a major provider of new

stratigraphic data which has resulted in several of these new techniques having been developed as a requirement to the industry furthermore because techniques such as isotope chemostratigraphy elemental chemostratigraphy magnetic susceptibility stratigraphy numerical biostratigraphy and heavy mineral stratigraphy are based around precise quantified and reproducible analytical data they provide an independent means to test the more interpretive stratigraphic methodologies this volume attempts an overview of stratigraphic methodologies but largely focuses on data generative stratigraphic techniques such as chemostratigraphy magnetic susceptibility stratigraphy numerical biostratigraphy and heavy mineral stratigraphy where appropriate each paper discusses data generation methods including sample preparation and analytical methods as well outlining data interpretation methods this is followed by case histories that demonstrate how those data are used to resolve stratigraphic problems commonly using material derived from petroleum basins around the world
