this is the second volume of a series of books in various aspects of mathematical physics mathematical physics has made great strides in recent years and is rapidly

becoming an important discipline in its own right the fact that physical ideas can help create new mathematical theories and rigorous mathematical theorems can help to push the limits of physical theories and solve problems is generally acknowledged we believe that continuous contacts between mathematicians and physicists and the resulting dialogue and the cross fertilization of ideas is a good thing this series of studies is published with this goal in mind the present volume contains contributions which were originally presented at the second nato advanced study institute on mathematical physics held in istanbul in the summer of 1972 the main theme was the application of group theoretical methods in general relativity and in particle physics modern group theory in particular the theory of unitary irreducible infinite dimensional representations of lie groups is being increasingly important in the formulation and solution of dynamical problems in various branches of physics there is moreover a general trend of rapprochement of the methods of general relativity and elementary particle physics we hope it will be useful to present these investigations to a larger audience

covering arguably one of the most attractive and mysterious mathematical objects the monster group this text strives to provide an insightful introduction and then discusses the current state of the field the monster group is related to many areas of mathematics as well as physics from number theory to string theory this book cuts through the complex nature of the field highlighting some of the mysteries and intricate relationships involved containing many meaningful examples and a manual introduction to the computer package gap it provides the opportunity and resources for readers to start their own calculations some 20 experts here share their expertise spanning this exciting field and the resulting volume is ideal for researchers and graduate students working in combinatorial algebra group theory and related areas

this volume is a tribute to maxim kontsevich one of the most original and influential mathematicians of our time maxim's vision has inspired major developments in many areas of mathematics ranging all the way from probability theory to motives over finite fields and has brought forth a paradigm shift at the interface of modern geometry and mathematical physics many of his papers have opened completely new directions of research and led to the solutions of many classical problems this book collects papers by leading experts currently engaged in research on topics close to maxim's heart contributors s donaldson a goncharov d kaledin m kapranov a kapustin i katzarkov a noll p pandit s pimenov j ren p seidel c simpson y soibelman r thorngren

this series is ideal for comprehensive reinforcement of essential skills to improve results and to develop a more thorough understanding the five books provide effective practice and consolidation of key mathematical skills for 11-16 year olds
