the first comprehensive guide to one of today's most innovative approaches to environmental contamination natural attenuation is gaining increasing attention as a nonintrusive cost effective alternative to standard remediation techniques for environmental contamination this landmark work presents the first in depth

examination of the theory mechanisms and application of natural attenuation written by four internationally recognized leaders in this approach the book describes both biotic and abiotic natural attenuation processes focusing on two of the environmental contaminants most frequently encountered in groundwater fuels and chlorinated solvents the authors draw on a wealth of combined experience to detail successful techniques for simulating natural attenuation processes and predicting their effectiveness in the field they also show how natural attenuation works in the real world using numerous examples and case studies from a wide range of leading edge projects nationwide involving fuel hydrocarbons and chlorinated solvents finally they discuss the evaluation and assessment of natural attenuation and explore the design of long term monitoring programs an indispensable reference for anyone working in environmental remediation natural attenuation of fuels and chlorinated solvents in the subsurface is essential reading for scientists and engineers in a range of industries as well as state and federal environmental regulators and professors and graduate students in environmental or chemical engineering

the manipulation of functional groups by oxidative or reductive processes is central to organic chemistry despite the importance of these reactions no existing text has attempted to summarize them simply for students together with a later volume in the series this book provides a clear and comprehensive summary of oxidative and reductive processes emphasizing general principles and common factors and showing the applications of these compounds in organic synthesis

selected constants oxidation reduction potentials of inorganic substances in aqueous solution presents tables that will aid chemists in finding the best or most probable value of the normal or formal oxidation reduction potential of oxidation reduction systems the book first presents numerical calculations that show the degree of oxidation and real oxidation reduction systems including the value of the potential temperature nature and composition of the medium and the method of determination used the text then takes a look at the choice of data as well as intensity potential curves and potentiometric determinations the table of oxidation reduction potentials showing the redox system medium method and references is presented the literature references starting from 1900 until 1967 are also tabulated the publication is a dependable reference for chemists and readers interested in the oxidation reduction potentials of inorganic substances in aqueous solutions
