peter vik s regression anova and the general linear model a statistics primer demonstrates basic statistical concepts from two different perspectives giving the reader a conceptual understanding of how to interpret statistics and their use the two perspectives are 1 a traditional focus on the t test correlation and anova and 2 a model comparison approach using general linear models glm this book juxtaposes the two approaches by presenting a traditional approach in one chapter followed by the same analysis demonstrated using glm by so doing students will acquire a theoretical and conceptual appreciation for data analysis as well as an applied practical understanding as to how these two approaches are alike

data analysis a model comparison approach to regression anova and beyond is an integrated treatment of data analysis for the social and behavioral sciences it covers all of the statistical models normally used in such analyses such as multiple regression and analysis of variance but it does so in an integrated manner that relies on the comparison of models of data estimated under the rubric of the general linear model data analysis also describes how the model comparison approach and uniform framework can be applied to models that include product predictors i e interactions and nonlinear effects and to observations that are nonindependent indeed the analysis of nonindependent observations is treated in some detail including models of nonindependent data with continuously varying predictors as well as standard repeated measures analysis of variance this approach also provides an integrated introduction to multilevel or hierarchical linear models and logistic regression finally data analysis provides guidance for the treatment of outliers and other problematic aspects of data analysis it is intended for advanced undergraduate and graduate level courses in data analysis and offers an integrated approach that is very accessible and easy to teach highlights of the third edition include a new chapter on logistic regression expanded treatment of mixed models for data with multiple random factors updated examples an enhanced website with powerpoint presentations and other tools that demonstrate the concepts in the book exercises for each chapter that highlight research findings from the literature data sets r code and sas output for all analyses additional examples and problem sets and test questions

this essential textbook provides an integrated treatment of data analysis for the social and behavioral sciences it covers all the key statistical models in an integrated manner that relies on the comparison of models of data estimated under the rubric of the general linear model the text describes the foundational logic of the unified model comparison framework it then shows how this framework can be applied to increasingly complex models including multiple continuous and categorical predictors as well as product predictors i e interactions and nonlinear effects the text also describes analyses of data that violate assumptions of independence homogeneity and normality the analysis of nonindependent data is treated in some detail covering standard repeated measures analysis of variance and providing an integrated introduction to multilevel or hierarchical linear models and logistic regression highlights of the fourth edition include expanded coverage of generalized linear models and logistic regression in particular a discussion of power and ethical statistical practice as it relates to the replication crisis an expanded collection of online resources such as powerpoint slides and test bank for instructors additional exercises and problem sets with answers new data sets practice questions and r code clear and accessible this text is intended for advanced undergraduate and graduate level courses in data analysis

noted for its model comparison approach and unified framework based on the general linear model glm this classic text provides readers with a greater understanding of a variety of statistical procedures including analysis of variance anova and regression

statistical modeling is a branch of advanced statistics and a critical component of many applications in science and business this book is an attempt to satisfy the need of mathematical statisticians and computational students in linear modeling and anova this book addresses linear modeling from a computational perspective with an emphasis on the mathematical details and step by step calculations using sas r proc iml this book covers correlation analysis simple and

stat2 introduces students to statistical modeling beyond what they have learned in a stat 101 college course or an ap statistics course building on basic concepts and methods learned in that course stat2 empowers students to analyze richer datasets that include more variables and address a broader range of research questions other than a working understanding of exponential and logarithmic functions there are no prerequisites beyond successful completion of their first statistics course to help all students make a smooth transition to this course chapter 0 reminds students of basic statistical terminology and also uses the familiar two sample t test as a way to illustrate the approach of specifying estimating and testing a statistical model using stat2 students will go beyond their stat 101 experience by learning to develop and apply models with both quantitative and categorical response variables and with multiple explanatory variables stat2 chapters are grouped into units that consider models based on the type of response and type of predictors discover that the practice of statistical modeling involves applying an interactive process stat2 employs a four step process in all statistical modeling choose a form for the model fit the model to the data assess how well the model describes the data and use the model to address the question of interest learn how to apply their developing judgment about statistical modeling stat2 introduces the idea of constructing statistical models at the very beginning in a setting that students encountered in their stat 101 course this modeling focus continues throughout the course as students encounter new and increasingly more complicated scenarios analyze and draw conclusions from real data which is crucial for preparing students to use statistical modeling in their professional lives stat2 incorporates real and rich data throughout the text using real data to address genuine research questions helps motivate students to study statistics the richness stems not only from interesting contexts in a variety of disciplines but also from the multivariable nature of most datasets
