due to the advances of various methods for the prediction of toxicity of organic compounds and ionic liquids it is necessary to review these methods for scientists and students it is essential to compare the advantages and shortcomings of these methods since many organic compounds and ionic liquids are synthesized each year this book introduces suitable models for the assessment of their toxicities this book reviews the best predictive methods for the prediction of toxicity of organic compounds and ionic liquids which were derived by in vitro or in vivo experiments different available quantitative structure toxicity relationship qstr models based on various descriptors have been discussed to predict toxicity parameters such as ld50 50 lethal dose ec50 the concentration of the desired ionic liquid that produces mortality of 50 percent of the bacterial population and log igc50 1 logarithm of 50 growth inhibitory concentration of t. pyriformis of various classes of organic compounds and ionic liquids the

reliability of these methods is compared and discussed each chapter contains some complimentary problems with their answers which can improve the experience of students and researchers the introduced subjects are suitable for advanced students in chemistry biochemistry medicinal chemistry and chemical engineering

217plus is a methodology and a software tool that was developed by the riac to aid in the assessment of system reliability it represents the next generation of the prism software tool initially released in 1999 the original software contained six embedded models to estimate the failure rate of various components when exposed to a specific set of stresses that are defined by the user the 217plus contains twelve embedded component models until the release of this handbook the equations comprising the component reliability prediction models were not available in printed form as such a user of the old software tool could not see the exact equations that comprised the models it is always advantageous for analysts to be able to review details of the models so that reliability prediction results can be better interpreted and supported through mutual practitioner management and customer understanding the riac therefore developed and published this handbook to make available the equations and model parameters that form the basis of the 217plus methodology

this book uncovers stakes and possibilities offered by computational intelligence and predictive analytics to medical science the main focus is on data technologies classification analysis and mining information retrieval and in the algorithms needed to elaborate the informations a section with use cases and applications follows the two main parts of the book respectively dedicated to the foundations and techniques of the discipline

analytical solutions to the orbital motion of celestial objects have been nowadays mostly replaced by numerical solutions but they are still irreplaceable whenever speed is to be preferred to accuracy or to simplify a dynamical model in this book the most common orbital perturbations problems are discussed according to the lie transforms method which is the de facto standard in analytical orbital motion calculations due to an oversight an error slipped in section 4 1 of the book where it is implicitly assumed the case of the kepler problem the following text should replace sections 4 1 and 4 2 of the book cross references may be affected with the new writing in particular former crossed references to eq 4 3 should now point to current eq 4 12 please find the erratum below

the intent of this book is to provide guidance on modeling techniques that can be used to quantify the reliability of a product or system in this context reliability modeling is the process of constructing a mathematical model that is used to estimate the reliability characteristics of a product there are many ways in which this can be accomplished depending on the product or system and the type of information that is available or practical to obtain this book reviews possible approaches summarizes their advantages and disadvantages and provides guidance on selecting a methodology based on the specific goals and constraints of the analyst while this book will not discuss the use of specific published methodologies in cases where examples are provided tools and methodologies with which the author has personal experience in their development are used such as life modeling nprd mil hdbk 217 and the riac 217plus introduction

this publication addresses the critical need for chemists engaged in the synthesis of new energetic compounds to

comprehensively evaluate physical and thermodynamic properties as well as sensitivity to various stimuli the book delves into established and emerging methods for predicting key properties such as crystal density heat of formation and melting points providing a thorough understanding of the subject matter in this revised edition we present updated insights across all chapters exploring topics like enthalpy and entropy of fusion heat of sublimation and correlations among different types of sensitivities additionally three new chapters focus on the assessment of energetic metal organic complexes including energetic metal organic frameworks mofs and energetic polymers alongside strategies for predicting properties of novel energetic compounds this book is an essential resource for researchers and practitioners in the field offering practical techniques and a solid foundation for advancing the synthesis and application of energetic materials its relevance extends to both academic and industrial settings making it a vital addition to the literature on energetic compounds this book uniquely integrates theoretical methods with practical applications for predicting properties of energetic compounds it addresses the gap in understanding the sensitivity and stability of new materials key features include updated methodologies new chapters on metal organic complexes and comprehensive coverage of critical properties
