the temperature measurement of liquid in a tank can be controlled by classical and advance control algorithms applying pid fuzzy logic sfb lqr here we consider a three tank noninteracting system we observed that tank1 affects the dynamic behavior of tank2 similarly tank2 affects the dynamic behavior of tank3 and vice versa because the flow rate  $f_1$  depends on the difference between liquid levels  $h_1$  and  $h_2$  thus a change in the inlet flowrate affects the liquid level in the tank which in turn affects the temperature of the liquid basically it is a thermal process various types of temperature sensors include rtd t c and thermistor in this particular project the author used a mercury thermometer as sensor mathematical models of the three tank method give a third order equation each tank gives a transfer function of the first order system they make it easy to check whether a particular algorithm is giving the requisite results a lot of work has been carried out on the temperature control in terms of its stabilization many attempts have been made to control the response of temperature measuring systems
