recent years have brought new insights to the understanding of parkinson s disease impact of exercise and sound displays in  
rehabilitation and movement facilitation there is growing evidence that auditory signals in the environment can provide a  
temporal template for movement and change the mode of motor control from intrinsic to extrinsic habitual to goal directed  
enabling enhanced motor performance in patients in addition forced exercise rate studies show that exercising at the pace of  
healthy adults can have potential neuroprotective benefits for patients many research groups have explored the use of auditory  
cues such as rhythmical auditory training in improving gait and upper limb movement parameters cues are usually either  
intermittent metronome or continuous dynamic sound displays similarly dance based interventions suggest that patients benefit  
from additional sensory information i e the temporal structure embedded in music and proprioceptive information from a  
dancing partner that facilitates movement on the contrary studies dedicated to auditory perception and motor timing report an  
impaired ability of patients to perceive and synchronise with complex rhythmical structures i e causing an inability to play  
musical instruments with the growth of modern technology and the increasing portability of hi specification devices such as  
smart phones new research questions on the design of interventions are beginning to emerge as we strive for more efficient  
therapeutic approaches in this research topic we wanted to bring together top scientists from the movement disorder motor  
control and sound related studies along with therapists that way we can engage in cross disciplinary and challenging scientific

debate about future rehabilitation avenues and frontiers for parkinson s disease patients
