new topics and extended sections such as diffusion conduction in thin films interconnects in microelectronics electromigration stefan s radiation law field emission from carbon nanotubes piezoresistivity amorphous semiconductors solar cells leds debye relaxation giant magnetoresistance magnetic data storage reststrahlen absorption luminescence and white leds and x ray diffraction appendix it also has a large number of new worked examples numerous new homework problems and many new illustrations and photographs this text is one of the few books in the market that has the broad coverage of electronic materials and devices that today s scientists and engineers need book jacket

this handbook provides the most comprehensive up to date and easy to apply information on the physics mechanics reliability and packaging of micro and opto electronic materials it details their assemblies structures and systems and each chapter contains a summary of the state of the art in a particular field the book provides practical recommendations on how to apply current knowledge and technology to design and manufacture it further describes how to operate a viable reliable and cost effective electronic component or photonic device and how to make such a device into a successful commercial product

the importance of materials science for the progress of electronic technology has been apparent to all since the invention of the transistor in 1948 though that epoch making event was the result of far sighted research planning by bell laboratories dating from a decade or more before no mere chance discovery therefore but the fruition of work which allotted at its inception a vital role to materials the transistor is now very old hat but new materials developments are continually triggering fresh developments in electronics from optical communications to high temperature superconductors electronic engineers are now given at least two courses in materials as part of their degree programme this book arose from a series of forty lectures the author gave to the third year students on the extended honours degree course in electronic and electrical engineering at loughborough university though additional elementary material has been included to make the book suitable for first year students the biggest problem in such a course is deciding what must be left out and this i am afraid i shirked by leaving out all those areas which i was not familiar with from my days in the ministry of aviation the semiconductor device industry and as a graduate student and research worker i hope that what remains is sufficiently catholic

volume is indexed by thomson reuters bci was the electronic properties of solids have become of increasing importance in the age of information technology the study of solids and materials while having originated from the disciplines of physics and chemistry has evolved independently over the past few decades the classical treatment of solid state physics which emphasized classifications theories and fundamental physical principles is no longer able to bridge the gap between materials advances and applications in particular the more recent developments in device physics and technology have not necessarily been driven by new concepts in physics or new materials but rather by the ability of engineers to control crystal structures and properties better via advances in crystal growth and patterning techniques in many cases new applications simply arise from the adaption of conventional ideas to interdisciplinary areas one example is that of recent advances which rely heavily upon the availability of the sub

the subject of electronics and in particular the electronic properties of materials is one which has experienced unprecedented growth in the last thirty years the discovery of the transistor and the subsequent development of integrated circuits has enabled us to manipulate and control the electronic properties of materials to such an extent that the entire telecommunications and computer industries are dependent on the electronic properties of a few semiconducting materials the subject area is now so important that no modern physics materials science or electrical engineering degree programme can be considered complete without a significant lecture course in electronic materials ultimately the course requirements of these three groups of students may be quite different but at the initial stages of the discussion of electronic properties of materials the course requirements are broadly identical for each of these groups furthermore as the subject continues to grow in importance the initial teaching of this vital subject needs to occur earlier in the curriculum in order to give the students sufficient time later to cover the increasing amount of material
