anchors are primarily used in the construction of foundations of earth supported and earth retaining structures the fundamental reason for using earth anchors in construction is to transmit the outwardly directed load to the soil at a greater depth and or farther away from the structure although earth anchors have been used in practice for several hundred years proper theoretical developments for purposes of modern engineering designs have taken place only during the past 40 to 45 years this book summarizes most theoretical and experimental works directed toward the development of proper relationships for ultimate and allowable holding capacity of earth anchors j ross publishing offers a supplemental download a customizable powerpoint instructional slide presentation prepared by the authors that complements the material covered in the book chapter by chapter

theoretical foundation engineering provides in depth reviews of the existing literature on lateral earth pressure sheet pile walls ultimate bearing capacity of shallow foundations holding capacity of plate and helical anchors in sand and clay and slope stability analysis the discussion of the ultimate bearing capacity of shallow foundations is comprehensive and the review of earth anchors is unique to this book the treatment is primarily theoretical and does not compete with existing foundation design books it will be welcomed as a useful reference by graduate students of geotechnical engineering consultants in the field as well as being a valuable addition to any civil engineering library an unabridged j ross publishing republication of the edition published by elsevier science publishers b v amsterdam 1987 440pp
