a new look at weak convergence methods in metric spaces from a master of probability theory in this new edition patrick billingsley updates his classic work convergence of probability measures to reflect developments of the past thirty years widely known for his straightforward approach and reader friendly style dr billingsley presents a clear precise up to date account of probability limit theory in metric spaces he incorporates many examples and applications that illustrate the power and utility of this theory in a range of disciplines from analysis and number theory to statistics engineering economics and population biology with an emphasis on the simplicity of the mathematics and smooth transitions between topics the second edition boasts major revisions of the sections on dependent random variables as well as new sections on relative measure on lacunary trigonometric series and on the poisson dirichlet distribution as a description of the long cycles in permutations and the large divisors of integers assuming only standard measure theoretic probability and metric space topology convergence of probability measures provides statisticians and mathematicians with basic tools of probability theory as well as a springboard to the industrial strength literature available today

this textbook offers a self contained introduction to probability covering all topics required for further study in stochastic processes and stochastic analysis as well as some advanced topics at the interface between probability and functional analysis the initial chapters provide a rigorous introduction to measure theory with a special focus on probability spaces next lebesgue integration theory is developed in full detail covering the main methods and statements followed by the important limit theorems of probability advanced limit theorems such as the berry esseen theorem and stein's method are included the final part of the book explores interactions between probability and functional analysis it includes an introduction to banach function spaces such as lorentz and orlicz spaces and to random variables with values in banach spaces the itô-nisio theorem the strong law of large numbers in banach spaces and the bochner pettis and dunford integrals are presented as an application brownian motion is rigorously constructed and investigated using banach function space methods based on courses taught by the authors this book can serve as the main text for a graduate level course on probability and each chapter contains a collection of exercises the unique combination of probability and functional analysis as well as the advanced and original topics included will also appeal to researchers working in probability and related fields

a companion to theoretical econometrics provides a comprehensive reference to the basics of econometrics this companion focuses on the foundations of the field and at the same time integrates popular topics often encountered by practitioners the chapters are written by international experts and provide up to date research in areas not usually covered by standard econometric texts focuses on the foundations of econometrics integrates real world topics encountered by professionals and practitioners draws on up to date research in areas not

covered by standard econometrics texts organized to provide clear accessible information and point to further readings

one of the greatest problems in engineering is reliability the performance of all machinery degrades over time and unless counteraction is taken at some point any system will eventually fail once a system fails there are a number of possible solutions the mathematical and statistical measurement and analysis of these solutions forms the mathematical theory of reliability the aim of the authors is to concentrate on aspects of particular importance in the mathematical theory of reliability of time dependent systems rather than give a general overview particular emphasis is placed on fault tree analysis monte carlo methods and importance measures this book will be of particular interest to applied researchers and engineers working in areas where reliability is crucial contents introduction markov and semi markov models as a basis for the mathematical analysis of system reliability methods for investigating homogeneous and non homogeneous point processes event flows fault trees the current state of research theory of redundant systems monte carlo methods reliability analysis using perturbation methods stiff processes in reliability analysis variance reduction methods analytical statistical methods for rapid simulation of repairable systems with structure redundancy measures of reliability importance of components index
