finally a completely revised updated and expanded edition of the artech house classic handbook of antennas for emc the second edition features a wealth of brand new material including chapters on recent techniques standards and measurements this invaluable resource provides a thorough understanding of the practical aspects and underpinnings of antennas in emc systems professionals find summaries of important underlying mathematics without the heavy theoretical emphasis that characterizes much of the existing literature professionals discover

which antennas to choose for electromagnetic em compatibility and compliance moreover this authoritative book offers a solid understanding of the main characteristics of an antenna in a qualitative manner essential reading for emc engineers this volume provides the knowledge needed to determine the right antenna for specific applications and offers guidance in conducting emc testing

this book aims to provide many advanced application topics for microwave circuits and high frequency electromagnetic em fields by using advanced design system ads and high frequency structure simulator hfss as simulation platforms in particular it contains the latest multidisciplinary co simulation guidance on the design of relevant components and devices currently the circuit field design and performance analysis and optimization strongly rely on various kinds of robust electronic design automation eda software rf microwave engineers must grasp two or more types of related simulation design software ads by keysight and hfss by ansys are the representative for circuit simulations and for field and structural simulations of microwave devices respectively at present these two types of software are widely used in enterprises universities and research institutions the main purpose of this book is to enable readers who are interested in microwave engineering and applied electromagnetics to master the applications of these two tools it also helps readers expand their knowledge boundaries behind those types of software and deepen their understanding of developing interdisciplinary technologies by co simulations the book is divided into three parts the first part introduces the two latest versions of ads and hfss and helps readers better understand the basic principles and latest functions better it also advises how to choose appropriate simulation tools for different problems the second part mainly describes co simulations for high frequency em fields microwave circuits antenna designs em compatibility emc and thermal and structural analyses it provides guides and advices on performing co simulations by ads and hfss incorporated with other types of software respectively the

last part narrates the automation interfaces and script programming methods for co simulations it primarily deals with the advanced extension language ael python data link pdl and matlab interface in ads for hfss it discusses vbscript ironpython scripting and application programming interface apis based on matlab each topic contains practical examples to help readers understand so that they can gain a solid knowledge and skills regarding automated interfaces and scripting methods based on these kinds of software concisely written in combination with practical examples this book is very suitable as a textbook in introductory courses on microwave circuit and em simulations and also as a supplementary textbook in many courses on electronics microwave engineering communication engineering and related fields as well it can serve as a reference book for microwave engineers and researchers

a genetic algorithm ga has been used in conjunction with the numerical electromagnetics code version 2 nec2 to create and optimize atypical wire antenna designs with impressive characteristics antenna design parameters are encoded into an ordered series of numbers and or symbols analogous to a biological chromosome a cost function that quantifies how well a design meets the engineer s specifications is created the ga uses these to generate and evaluate a population of designs the most successful designs are then promoted and mixed through mating and mutation while poor designs are removed this process difficult to trap in local minima continues until convergence criteria are met generally yielding excellent designs with no user intervention or initial guesses three antennas have been optimized a monopole loaded with a modified folded dipole the yagi antenna and the crooked wire genetic

antenna prior study of the loaded monopole had shown hemispherical coverage was possible the ga found an asymmetric loaded monopole with an average variation in gain over the hemisphere of only 0.4db confirmed by measurement ga optimized yagi antennas surpassed the gain of conventional yagis by about 1db improvement also confirmed by measurement the ga designed a yagi with a beamwidth of 50 deg 60 deg sidelobes nearly 25db down and a 14 bandwidth specifications difficult to achieve using conventional techniques the crooked wire genetic antenna is several wires joined in series locations and lengths are determined by the ga optimization for hemispherical coverage with right hand circular polarization rhcp produced highly unusual shapes unrealizable using a conventional approach rhcp hemispherical coverage was achieved with less than 4db variation measurements verify the results
