the structural representation of proximity matrices with matlab presents and demonstrates the use of functions by way of m files within a matlab computational environment to effect a

variety of structural representations for the proximity information that is assumed to be available on a set of objects the representations included in the book have been developed primarily in the behavioral sciences and applied statistical literature e g in psychometrics and classification although interest in these topics now extends more widely to such fields as bioinformatics and chemometrics throughout the book two kinds of proximity information are analyzed one mode and two mode one mode proximity data are defined between the objects from a single set and are usually given in the form of a square symmetric matrix two mode proximity data are defined between the objects from two distinct sets and are given in the form of a rectangular matrix in addition there is typically the flexibility to allow the additive fitting of multiple structures to either the given one or two mode proximity information

recent advancements in medical and industrial internet of things have raised security concerns as vulnerabilities can impact critical systems workflows privacy and safety the window of vulnerability ranging from days to months allows attackers to exploit weaknesses before patches are applied manual mitigation is time consuming especially when specific component versions are affected to address this a multi modal security architecture was developed dividing complex systems into operational modes with different risks a mode switching framework enables security engineers to mitigate threats by sharing information and trigger manual or automated contingency responses adapting system behavior configuration and functionality to reduce exposure model driven techniques and a domain specific language facilitate the definition of mitigation strategies as mode switches
