this volume elaborates the idea that harmonic analysis on a spherical variety  $x$  is intimately connected to the langlands program in the local setting the key conjecture is that the spectral decomposition of  $L^2 x$  is controlled by a dual group attached to  $x$  guided by this the authors develop a plancherel formula for  $L^2 x$  formulated in terms of simpler spherical varieties which model the geometry of  $x$  at infinity this local study is then related to global conjectures namely conjectures about period integrals of automorphic forms over spherical subgroups publisher s description

while the text covers the standard range of material from kinematics to quantum physics hecht has carefully limited the math required to basic calculus and very basic vector analysis he omits obscure high level topics while focusing on helping students understand the fundamental concepts of modern day physics calculus and vector analysis are both painstakingly developed as tools and then used only insofar as they illuminate the physics hecht deliberately goes slowly justifies where each topic is going stops to take stock of where the students have been and points out the marvelous unity of the discourse informed by a 20th century perspective and a commitment to providing a conceptual overview of the discipline this book is a return to basics
