heat and mass transfer in particulate suspensions is a critical review of the subject of heat and mass transfer related to particulate suspensions which include both fluid particles and fluid droplet suspensions fundamentals recent advances and industrial applications are examined the subject of particulate heat and mass transfer is currently driven by two significant applications energy transformations primarily combustion and heat transfer equipment the first includes particle and droplet combustion processes in engineering suspensions as diverse as the fluidized bed reactors for s and internal combustion engines ice s on the heat transfer side cooling with nanofluids which include nanoparticles has attracted a great deal of attention in the last decade both from the fundamental and the applied side and has produced several scientific publications a monograph that combines the fundamentals of heat transfer with particulates as well as the modern applications of the subject would be welcomed by both academia and industry

the rapid growth of literature on convective heat and mass transfer through porous media has brought both engineering and fundamental knowledge to a new state of completeness and depth additionally several new questions of fundamental merit have arisen in several areas which bear direct relation to further advancement of basic knowledge and applications in this field for example the growth of fundamental heat transfer data and correlations for engineering use for saturated media has now reached the point where the relations for heat transfer coefficients and flow parameters are known well enough for design purposes multiple flow field regimes in natural convection have been identified in several important enclosure geometries new questions have arisen on the nature of equations being used in theoretical studies i e the validity of darcy assumption is being brought into question wall effects in high and low velocity flow fields have been found to play a role in predicting transport coefficients the formulation of transport problems in fractured media are being investigated as both an extension of those in a homogeneous medium and for application in engineering systems in geologic media and problems on saturated media are being addressed to determine their proper formulation and solution the long standing problem of how to adequately formulate and solve problems of multi phase heat and mass transfer in heterogeneous media is important in the technologies of chemical reactor engineering and enhanced oil recovery

although the empirical treatment of fluid flow and heat transfer in porous media is over a century old only in the last three decades has the transport in these heterogeneous systems been addressed in detail so far single phase flows in porous media have been treated or at least formulated satisfactorily while the subject of two phase flow and the related heat transfer in porous media is still in its infancy this book identifies the principles of transport in porous media and compares the available predictions based on theoretical treatments of various

transport mechanisms with the existing experimental results the theoretical treatment is based on the volume averaging of the momentum and energy equations with the closure conditions necessary for obtaining solutions while emphasizing a basic understanding of heat transfer in porous media this book does not ignore the need for predictive tools whenever a rigorous theoretical treatment of a phenomena is not available semi empirical and empirical treatments are given

this brief stands as a primer for heat transfer fundamentals in heat transfer enhancement devices the definition of heat transfer area passive and active enhancement techniques and their potential and benefits and commercial applications it further examines techniques and modes of heat transfer like single phase flow and two phase flow natural and forced convection radiation heat transfer and convective mass transfer

in recent years the interest of the scientific community towards efficient energy systems has significantly increased one of the reasons is certainly related to the change in the temperature of the planet which has increased by 0.76 c with respect to preindustrial levels according to the intergovernmental panel on climate change ipcc and is still increasing the european union considers it vital to prevent global warming from exceeding 2 c with respect to pre industrial levels as it has been proven that this will result in irreversible and potentially catastrophic changes these changes in climate are mainly caused by greenhouse gas emissions related to human activities and can be drastically reduced by employing energy systems for the heating and cooling of buildings as well as for power production characterized by high efficiency levels and or based on renewable energy sources this special issue published in the energies journal includes 13 contributions from across the world including a wide range of applications such as hybrid residential renewable energy systems desiccant based air handling units heat exchanges for engine whr solar chimney systems and other interesting topics
