process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process it plays a major part in determining the cost of components and affects all factory activities company competitiveness production planning production efficiency and product quality it is a crucial link between design and manufacturing there are several levels of process planning activities early in product engineering and development process planning is responsible for determining

the general method of production the selected general method of production affects the design constraints in the last stages of design the designer has to consider ease of manufacturing in order for it to be economic the part design data is transferred from engineering to manufacturing and process planners develop the detailed work package for manufacturing a part dimensions and tolerances are determined for each stage of processing of the workpiece process planning determines the sequence of operations and utilization of machine tools cutting tools fixtures gauges and other accessory tooling are also specified feeds speeds and other parameters of the metal cutting and forming processes are determined

the motivation for this book came out of a shared belief that what passed as theory in operations management om was all too often inadequate in one respect om scholars were bending over backwards to make theories from other fields fit our research problems in another questionable assumptions were being used to apply mathematics to om problems neither proved a good match with what the authors had observed in practice successful operations were managed by considerations that were far more straightforward than much of what was being published the authors of this book codify these practical considerations into a set of ten fundamental principles that bring together a century of operations management thinking the authors then apply these principles to important topics such as process design process improvement the supply chain new product development project management environmental sustainability and the interfaces between operations management and other business school disciplines

discover how to apply engineering thinking and data analytics to business operations this comprehensive textbook shows readers how to develop their engineering thinking and analytics to support making strategic and tactical decisions in managing and control of operations systems and supply chains the book is created in a modular fashion so that sections and chapters can stand alone and be used within operations courses across the spectrum operations engineering and management concepts analytics and principles for improvement is based on the author's successful classes in both business and engineering the book presents concepts and principles of operations management with a strong emphasis on analytics and a sharp focus on improving operations you will explore both the engineering approach to operations e.g. analytics and engineering thinking and the classic management approach focuses on teaching and developing strong problem solving analytics skills each section is designed to stand alone and can be used in a wide variety of courses written by an operations management and engineering expert

process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process it plays a major part in determining the cost of components and affects all factory activities company competitiveness production planning production efficiency and product quality it is a crucial link between design and manufacturing in spite of the importance of process planning in the manufacturing cycle there is no formal methodology which can be used or can help to train personnel for this job process planning activities are predominantly labor intensive depending on the experience and the skill and intuition of the planner and therefore often precludes a thorough analysis and optimization of the process plan which nearly always results in higher than necessary production costs delays errors and non standardization of

processes process planning is regarded as an art and not a science research in the field of process planning has indicated that all experts have their own expertise and one expert's experience might be different from that of another it is rare therefore for two planners to produce the same process each process will produce the part as specified although different processes will result in different processing times and costs the question is who is an expert by definition an expert is one having or manifesting the knowledge skill and experience needed for success in a particular field or endeavor or one who has acquired special skill in or knowledge and mastery of something
