many probability books are written by mathematicians and have the built in bias that the reader is assumed to be a mathematician coming to the material for its beauty this textbook is geared towards beginning graduate students from a variety of disciplines whose primary focus is not necessarily mathematics for its own sake instead a probability path is designed for those requiring a deep understanding of advanced probability for their research in statistics applied probability biology operations research mathematical finance and engineering a one semester course is laid out in an efficient and readable manner covering the core material the first three chapters provide a functioning knowledge of measure theory chapter 4 discusses independence with expectation and integration covered in chapter 5 followed by topics on different modes of convergence laws of large numbers with applications to statistics quantile and distribution function estimation and applied probability two subsequent chapters offer a careful treatment of convergence in distribution and the central limit theorem the final chapter treats conditional expectation and martingales closing with a discussion of two fundamental theorems of mathematical finance like adventures in stochastic processes resnick s related and very successful textbook a probability path is rich in appropriate examples illustrations and problems and is suitable for classroom use or self study the present uncorrected softcover reprint is designed to make this classic textbook available to a wider audience this book is different from the classical textbooks on probability theory in that it treats the measure theoretic background not as a prerequisite but as an integral part of probability theory the result is that the reader gets a thorough and well structured framework needed to understand the deeper concepts of current day advanced probability as it is used in statistics engineering biology and finance the pace of the book is quick and disciplined yet there are ample examples sprinkled over the entire book and each chapter finishes with a wealthy section of inspiring problems publications of the international statistical institute this textbook offers material for a one semester course in probability addressed to students whose primary focus is not necessarily mathematics each chapter is completed by an exercises section carefully selected examples enlighten the reader in many situations the book is an excellent introduction to probability and its applications revue roumaine de mathématiques pures et appliquées

a bestseller in its french edition this book is original in its construction and its success in the french market demonstrates its appeal it is based on three principles 1 an organization of the chapters by families of algorithms

exhaustive search divide and conquer etc on the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings some of these will be found in different chapters 2 for each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 for the most part the book details 150 problems spanning seven families of algorithms for each problem a precise and progressive statement is given more importantly a complete solution is detailed with respect to the design principles that have been presented often some classical errors are pointed out roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions

in both the linguistic and the language engineering community the creation and use of annotated text collections or annotated corpora is currently a hot topic annotated texts are of interest for research as well as for the development of natural language pro cessing nlp applications unfortunately the annotation of text material especially more interesting linguistic annotation is as yet a difficult task and can entail a substan tial amount of human involvement allover the world work is being done to replace as much as possible of this human effort by computer processing at the frontier of

what can already be done mostly automatically we find syntactic wordclass tagging the annotation of the individual words in a text with an indication of their morpho syntactic classification this book describes the state of the art in syntactic wordclass tagging as an attempt to give an overall view of the field this book is of interest to at least two possibly very different types of reader the first type consists of those people who are using or are planning to use tagged material and taggers they will want to know what the possibilities and impossibilities of tagging are but are not necessarily interested in the internal working of automatic taggers this on the other hand is the main interest of our second type of reader the builders of automatic taggers and other natural language processing software

increasing evidence suggests that the composition and spatial configuration the pattern of forest landscapes affect many ecological processes including the movement and persistence of particular species the susceptibility and spread of disturbances such as fires or pest outbreaks and the redistribution of matter and nutrients understanding these issues is key to the successful management of complex multifunctional forest landscapes and landscape ecology based on a foundation of island bio geography and meta population dynamic theories provides the rationale to deal with this pattern to process interaction at different spatial and temporal scales this carefully edited volume represents a stimulating addition to the international literature on landscape ecology and resource management it provides key insights into some of the applicable landscape ecological theories that underlie forest management with a specific focus on how forest management can benefit from landscape ecology and how landscape ecology can be advanced by tackling challenging problems in forest landscape management it also presents a series of case studies from europe asia north america africa and australia exploring the issues of disturbance diversity management and scale and with a specific focus on how human intervention affects forest landscapes and in turn how landscapes influence humans and their culture an important reference for advanced students and researchers in landscape ecology conservation biology forest ecology natural resource management and ecology across multiple scales the book will also appeal to researchers and practitioners in reserve design ecological restoration forest management landscape planning and landscape architecture

since the 1980s there has been a renewed interest in attempts to introduce a sense of history into economic literature in this book the authors argue that it is not possible to explain a state of the world without first analysing the processes that lead to that state the contributions collected in this volume share a critical stance towards the timelessness and a historical theorizing of mainstream economics past states in the development of an economic process set the range of possibilities for future development and can be used to construct theories based on the irreversibility of economic time many of these notable contributors argue that the study of the history of economic thought is important in two ways firstly because it provides important insights into the ways that economists of the past attempted to address the problems of history and secondly because it helps us to understand the present state of economics as being itself the outcome of a path dependent process evolutionary economists economic theorists and historians as well as economists interested in the evolution of economic and other social institutions will find this challenging collection of papers essential reading
