endodontic treatment is largely performed on teeth significantly affected by caries multiple repeat restorations and or fracture already structurally weakened such teeth are often further weakened by the endodontic procedures designed to provide optimal access and by the restorative procedures necessary to rebuild the tooth root canal treatment weakens tooth structure and predisposes teeth to fracture root filled teeth are more susceptible to fracture than teeth with intact pulps because of loss of tooth structure due to caries trauma and root canal preparation use of intracanal medicament and few irrigants also contributes to decrease in fracture resistance of tooth in addition lateral compaction creates stresses in the root during obturation which could lead to subsequent fracture

presenting a guide to clinical practice this book is intended as an undergraduate text for dental students it also aims to be useful to dental practitioners in their day to day practice

dentine bonding systems composite resins and fibre posts have widely replaced cast posts and amalgam as core materials all ceramic and composite crowns have also replaced metal ceramic crowns in many aesthetic cases the aim of this book is to provide the general practitioner with some principles and techniques for the adhesive restoration of root filled teeth

restoration of an endodontically treated tooth because of the significant loss of tooth structure often requires additional support from the root canal by means of a post and core restoration however post may generate stresses which lead to vertical root fracture and loss of the tooth since post design material used and the post space preparation has a significant influence on vertical fracture prevalence broad investigation is in progress to find out the optimum procedure esthetic functional and structural rehabilitation of a pulpless tooth are critically important to ensure a successful restorative outcome in cases where most of the coronal portion is lost a common method to restore such teeth is the use of a post and core onto which a full crown is cemented the post functions primarily to aid the retention of the restoration and to protect the tooth by dissipating or distributing forces along the tooth on the contrary the tooth is weakened if dentin is sacrificed to place a large diameter dowel the main purpose of this study was to evaluate the ability of different types of posts to reinforce endodontically treated teeth

this book serves as a clinical guide to help the practitioner improve endodontic treatment outcomes it focuses on the various factors affecting the prognosis of endodontic treatments and on their impact on short term and long term results the text incorporates up to date

knowledge techniques and treatment protocols each chapter has been carefully chosen to address either foundational knowledge or a select aspect of endodontic treatment the authors analyze the knowledge accumulated from a large number of outcome studies and provide the reader with a critical appraisal indicating the strengths and weaknesses of those studies this information is then used to make recommendations on how to predict the outcome of the intended treatment the authors emphasize that the endodontic prognosis is a multifactorial phenomenon underscoring how various factors singularly and in combination influence the treatment outcome readers are provided with tools to successfully assess the prognosis of the proposed treatment at the outset and to execute the planned treatment focused on optimal outcome
