influenza continues to be one of the major epidemic diseases of man and is in fact his only remaining pandemic disease beveridge 1969 this is largely because influenza virus undergoes extreme antigenic variation the mechanism of which is still poorly understood two kinds of antigenic variation occur in influenza viruses antigenic drift and major antigenic shifts both involve changes in the hemagglutinin and neuraminidase antigens on the surface of the virus antigenic drift which involves gradual changes in the surface antigens of influenza virus is thought to result from the selection by an immune population of mutant virus particles with altered antigenic determinants these mutants therefore possess a growth advantage in the presence of antibody franscis and maassab 1965 archetti and horsfall 1950 hamre et al 1958 it has been shown that antigenic mutants isolated in vitro by selection with antibody have changes in amino acid sequence in the polypeptides of the hemagglutinin subunits laver and webster 1968 and it is likely that antigenic drift in the neuraminidase occurs by the same mechanism
