this is the second of two volumes that review for the first time all major aspects of photorefractive effects and their applications
 photorefractive effects in electro optic crystals are based on optically induced space charge fields which ultimately alter the refractive indices by the electro optic pockels effect
 the fundamental phenomena leading to photoinduced changes of refractive index
 the materials requirements and experimental results on a variety of photorefractive materials are discussed and the most recent theoretical models describing these phenomena are presented
 interest in photorefractive materials has increased in recent years mainly because of their potential for nonlinear optical devices and for optical signals processing applications
 most of these applications are reviewed in this volume
 the contributions to the two volumes are written by experts on each topic and are intended for scientists and engineers active in the field and for researchers and graduate students entering the field
