similar to the literature findings which indicated that the level of successful lean transformation in developing countries is low the assessment revealed that the lean transformation level in local companies in saudi arabia is between 30 and 40 and in multinational companies the level is between 50 and 60 both local and multinational companies in the case of saudi arabian industry considered lack of suppliers involvement lack of cooperation from suppliers lack of good quality suppliers and slow response to market due to demand fluctuations as the root barriers that need to be addressed at the primary stages of lean transformation the resulting framework provides clear phases with an estimated timeline for each phase from the foundation phase to the excellence level phase in addition it involves executive leaders and a cross functional team to mentor and assess the transformation after each phase the framework comprises several methods and tools that can be considered critical success factors for lean transformation which will enable companies in developing countries to move toward achieving a successful lean transformation and sustainability as well as reaching higher and persistent levels of growth

the success of a lean manufacturing program depends far more on organization wide leverage of lean manufacturing tools than it does on the tools themselves to this the organization must add the human relations aspects that earn buy in and engagement by all members of the workforce to the extent that workers will react immediately and decisively to the presence of waste the synergy of the human and technological aspects of lean form what henry ford called a universal code for the achievement of world class results in any enterprise and which he put into practice to deliver unprecedented bottom line results this book expands upon and systemizes this universal code into a structure or framework that promotes organizational self audits and continuous improvement the book s first section offers a foundation of four simple but comprehensive lean key performance indicators kpis waste of the time of things as in cycle time waste of the time of people waste of energy and waste of materials the toyota production system s seven wastes are all measurable in terms of these four kpis which also cover the key metrics of eliyahu goldratt s theory of constraints throughput inventory and operating expense the first section then adds a proactive improvement cycle that sets out to look for trouble by isolating processes for analytical purposes and measuring and then balancing inputs and outputs to force all wastes to become visible it is in fact technically impossible for any waste of material or energy to hide from what chemical engineers call a material and energy balance application of this book s content should therefore satisfy most provisions of the iso 14001 environmental management system standard and the new iso 50001 energy management system standard the second section consists of an unofficial and therefore customizable standard against which the organization can audit its lean management system the unofficial standard is designed to be compatible with iso 9001 2008 so internal auditors can assess both systems simultaneously each provision includes numerous examples of questions that promote audits in a narrative form as opposed to yes no checklists or likert scale ratings the unofficial standard can also be downloaded without the assessment questions from the publisher s site the third section elaborates in detail on the second and provides numerous real

world examples of applications

lean is the popular philosophy in the present business management strategies with immediate benefits from implementation of lean in business processes all major organizations had started deploying it on the other hand health and safety management system hsms has changed its facet from obligatory requirement to a legal requirement the governments from across the world has increased focus on hsms and are changing the legal regulations accordingly in this highly regulated environment it is required by all organizations to change its reactive approach to proactive approach in this context our paper reviews the lean management its relevance in hsms and development of a structured framework for implementation

lean principles and practices have been widely adopted in manufacturing over the last decades but recently spread its applicability to other industry environments their use in the warehouse environment has been slower to get wise even though some researchers think that its application can contribute to the achievement of lower costs of operations and the increase of flexibility and efficiency lean warehousing has become necessary and plays a critical role that must be integrated into the entire supply chain which is increasingly becoming a pull approach driven by customer demand the academic literature on the subject of lean warehousing is still short and lacks of case studies that reflect the applicability of lean tools in warehousing this study aims to contribute with an application of a conceptual analysis in a real warehousing setting the framework followed has been taken from literature and proposes three different lean tools to apply for such analysis starts providing an extensive analysis with the 5w lean tool of the 7 wastes muda complemented with a numerical analysis to assess the impact of such waste in the daily warehouse operation then with the application of 5s lean tool in the warehouse processes several suggestions of implementation are presented in order to control waste smooth material flows and standardize processes

all proposals are illustrated in a future state vsm that compared to the current state vsm permits to obtain the value of improvement the findings reveal that significant benefits can be obtained with the application of lean tools in the warehouse operation
