many healthcare workers must deal on a daily basis with the transportation preparation storage clean up and disposal of cytotoxic drugs which are used in chemotherapy because of their harmful effect on cancer cells these drugs also have harmful effects on good cells and they therefore pose a significant health risk to those who work with them yet there is little safety and health information available about them and what information is available is scattered across a vast array of literature the safety and health

handbook for cytotoxic drugs collects this information so that healthcare workers can better understand the drugs they work with and the safety and health procedures that should be followed in it author samuel j murff presents comprehensive technical and procedural information on 106 of the most common cytotoxic drugs the book provides guidance on quickly dealing with spills reducing unnecessary exposure and complying with pertinent regulations and standards in order to better equip healthcare workers to maintain a safe work environment

since cytotoxic drugs were first developed their damaging effects on bone marrow have attracted considerable interest we now know that the bone marrow is an organ with rapid cell renewal in which maintenance of the steady state depends on a high rate of cell production and that the bone marrow toxicity of cytotoxic agents can be explained by the perturbation of such steady state conditions experimental researchers have analysed in detail the effects of cytotoxic agents upon defined hematopoietic cell populations to define the mechanism of action and the location within the cell cycle at which cytotoxic drugs exert their cytotoxic action from such studies a classification of cytotoxic agents according to their action upon cells during different phases of the cell cycle has been proposed 80 82 others have used the acute perturbation of the hematopoietic systems caused by application of single high doses of cytotoxic agents to analyse the patterns of depletion and reconstitution of the various hematopoietic compartments in an effort to shed light on the regulatory mechanisms that are responsible for the delicately balanced cell production of the hematopoietic cell renewal systems a great deal of information on the structure of the hematopoietic systems has come from such studies and kinetic parameters of these systems have been defined to clinicians the hematopoietic toxicity of antineoplastic agents has been an undesired though unavoidable side effect of almost all cytotoxic drugs introduced into clinical practice

the first part of this book summarizes the rationale and the preclinical data for combined treatment with ionizing radiation and pharmaceutical agents individual chapters focus on forms of combined treatment with due consideration being given to a range of drugs and to emerging combinations with small molecules and antibodies the second part comprises a series of disease specific chapters in which the clinical results of combined modality treatment are presented

there is now a range of cytotoxic drugs that have considerable clinical usefulness in producing responses in tumors and even in a small proportion of cases cure however the

acquisition of drug resistance is a major clinical problem and is perhaps the main limiting factor in successful treatment of cancer thus a tumor initially sensitive to chemotherapy will in the majority of cases eventually recur as a resistant tumor which will then progress much of our understanding of drug resistance mechanisms comes from the study of tumor cell lines grown in tissue culture we now understand many of the molecular mechanisms that can lead to a cell acquiring resistance to anticancer drugs however we still do not know which mechanisms are those most relevant to the problem of clinical drug resistance indeed given that many of the cytotoxic anticancer drugs were discovered by random screening it is clear what features give a clinically useful anticancer drug a sufficient therapeutic index to be of value the aim of cytotoxic drug resistance mechanisms is to provide protocols that are appropriate for examining the mechanisms of cellular resistance to anticancer cytotoxics in human tumor samples tumor cell lines have been enormously useful as experimental models of drug resistance mechanisms however they have limitations and we need to address the relevance of such mechanisms in patients tumors examining drug resistance in tumors is much more problematic than in cell lines

the extravasation of cytotoxic agents can result in severe local tissue damage and medical emergencies during tumour therapy this revised compendium is intended to help clinicians assess any situation speedily and with certainty the general section of the book includes topics such as predisposition prevention type of harm general measures in handling extravasated drugs specific antidotes and documentation in the 2nd edition the scientific information contained in the general section and relating to the actual substances has been updated the substance specific part of the book includes detailed instructions on handling more than 50 cytotoxic drugs to initiate targeted measures templates for an extravasation set overview tables documentation sheets and patient information as well as a cd rom are included to support clinical practice the book is the outcome of a consensus of an interdisciplinary working group that has collected and systematically reviewed all published literature on the topic
