barrows i.e. burial mounds are amongst the most important of Europe's prehistoric monuments  
across the continent barrows still figure as prominent elements in the landscape many of these  
mounds have been excavated revealing much about what was buried inside these intriguing  
monuments surprisingly little is known about the landscape in which the barrows were situated  
and what role they played in their environment palynological data carrying important clues on  
the barrow environment are available for hundreds of excavated mounds in the Netherlands  
however while local vegetation reconstructions from these barrows exist a reconstruction of the  
broader landscape around the barrows has yet to be made this makes it difficult to understand  
their role in the prehistoric cultural landscape in this book a detailed vegetation history of the  
landscape around burial mounds is presented newly obtained and extant data derived from  
palynological analyses taken from barrow sites are re-analysed methods in barrow palynology

are discussed and further developed when necessary newly developed techniques are applied in order to get a better impression of the role barrows played in their environment it is argued in this book that barrows were built on existing heaths which had been and continued to be maintained for many generations by so called heath communities these heaths therefore can be considered as ancestral heaths the barrow landscape was part of the economic zone of farming communities while the heath areas were used as grazing grounds the ancestral heaths were very stable elements in the landscape and were kept in existence for thousands of years in fact it is argued that these ancestral heaths were the most important factor in structuring the barrow landscape
