securing global transportation networks demonstrates how improved security processes can create value across all the business functions throughout an entire value chain readers will learn a whole new security management philosophy as explained through domestic and international examples and case studies ranging from major retailers such as home depot to shipping giants such as maersk and fedex this book also looks ahead to future developments and best practices for the future if you re charged with making or evaluating transportation security decisions you ll find the tools you need to succeed and prosper with the total security management approach explains globalization s impact on transportation networks creates a framework for realizing a return on security investments by integrating it as a core business process details how transportation firms investors and insurance companies can measure and reward smart security practices that protect a firm s fixed assets assets in transit brand equity and goodwill and human capital

the development of efficient network structures for freight transport is a major concern for the current global market demands need to be quickly transported and should also meet the customer needs in a short period of time traffic congestions and delays must be minimized since co2 emissions must be controlled and affordable transport costs have to be offered to customers hub and spoke structure is a current network model used by both regional and intercontinental transportation which offers an economy of scale for aggregated demands inside hub nodes however delays traffic congestions and long delivery time are drawbacks from this kind of network in this thesis a new concept which is called sub hub is proposed to the classic hub and spoke network structure in the proposed network models economy of scale and shorter alternative paths are implemented thus minimizing the transport cost and delivery time the sub hub proposal can be viewed as a connection point between two routes from distinct and close regions

transshipments without the need to pass through hub nodes are possible inside sub hubs this way congestions can be avoided and consequently delays are minimized four binary integer linear programming models for hub location and routing problem were developed in this thesis networks with sub hub and networks without sub hub taking into account circular hub routes or direct connections between hubs are compared these models are composed of four sub problems location allocation service design and routing which hinders the solution a cutting plane approach was used to solve small instances of problem while a variable neighborhood decomposition search vnds composed of exact methods matheuristic was developed to solve large instances the vnds was used to explore each sub problem by different operators major benefits are provided by models with sub hub thus promoting the development of more competitive networks

this book contains an abundance of numerical analyses based on significant data sets illustrating importance of environmentally friendly solutions requiring transport networks to be redesigned or clean zones to be implemented what kind of steps should be taken to redesign transport network how to evaluate efficiency or flexibility of transport system and city logistics what factors can be taken into account in the process of optimizing the functioning of public transport or paid parking zones how to optimize supply chains including last mile delivering and routing problem which of the multi criteria methods should be applied to support decision making processes while tackling problems of global transport systems answers to these and many other questions can be found in this book with regard to the research results discussed and the selected solutions applied the book entitled decision support methods in modern transportation systems and networks primarily addresses the needs of three target groups scientists and researchers its field local authorities responsible for the transport systems at the urban and regional level representatives of business traffic strategy management and industry manufacturers of its components

transport communications is a ground breaking study into the future of transporting both people and goods more efficiently the authors examine how existing modes of transport can be made more effective by the use of modern communications technology examples include rfid tags which allow goods to be tracked electronically at every stage of their journey from the point of

manufacture to the point of delivery they show how possible future developments will continue to revolutionize transport systems leading to better cleaner more cost effective systems for example the concept of computer controlled rail systems such as london s dockland light railway could be taken a stage further to apply to vehicles which don t run on rails or the smart traffic control system in milton keynes which sense traffic flow and adjusts signal phasing accordingly

this thesis examines how well gtn is performing in the area of in transit visibility since becoming operational in august of 1997 especially compared with commercial tracking systems the results of this research will provide valuable insights into the actual in transit visibility capabilities of the gtn system abstract
