semantic analysis and understanding of human behaviour in video streaming investigates the semantic analysis of the human behaviour captured by video streaming and introduces both theoretical and technological points of view video analysis based on the semantic content is in fact still an open issue for the computer vision research community especially when real time analysis of complex scenes is concerned this book explores an innovative original approach to human behaviour analysis and understanding by using the syntactical symbolic analysis of images and video streaming described by means of strings of symbols a symbol is associated to each area of the analyzed scene when a moving object enters an area the corresponding symbol is appended to the string describing the motion this approach allows for characterizing the motion of a moving

object with a word composed by symbols by studying and classifying these words we can categorize and understand the various behaviours the main advantage of this approach lies in the simplicity of the scene and motion descriptions so that the behaviour analysis will have limited computational complexity due to the intrinsic nature both of the representations and the related operations used to manipulate them besides the structure of the representations is well suited for possible parallel processing thus allowing for speeding up the analysis when appropriate hardware architectures are used a new methodology for design systems for hierarchical high semantic level analysis of video streaming in narrow domains is also proposed guidelines to design your own system are provided in this book designed for practitioners computer scientists and engineers working within the fields of human computer interaction surveillance image processing and computer vision this book can also be used as secondary text book for advanced level students in computer science and engineering

the concept of innate immunity refers to the first line host defense that serves to limit infection in the early hours after exposure to microorganisms recent data have highlighted similarities between pathogen recognition signaling pathways and effector mechanisms of innate immunity in drosophila and mammals pointing to a common ancestry of these defenses in addition to its role in the early phase of defense innate immunity in mammals appears to play a key role in stimulating the subsequent clonal response of adaptive immunity recent exciting information has determined that the templates that are laid down in primitive life forms like flowering plants and insects form the basic principles of first line host defense that are conserved in mammalian systems the next frontier in the field is to understand the dynamic adaptive changes that occur as a result of the inter play between host defenses and infectious agents one emerging theme is that microorganisms are constantly seeking ways to co opt host defenses on the other hand host defense to infection is mediated by the coordinate action of pattern recognition molecules and receptors that in mammals are important and probably necessary antecedents to the development of an adaptive immune response innate

immunity aims to explore the intersection between host pathogen interactions across an evolutionary spectrum that will inform our understanding of the dynamic interplay between infectious agents and host defense in man
