for the first time international guidelines for seismic design of port structures have been compiled in this comprehensive book these guidelines address the limitations inherent in conventional design and establish the framework for an evolutionary design strategy based on seismic response and performance requirements the provisions reflect the diverse nature of port facilities throughout the world where the required functions of port structures economic and social environment and seismic activities may differ from region to region this book comprises a main text and eight technical commentaries the main text introduces the reader to basic earthquake engineering concepts and a strategy for performance based design while the technical commentaries illustrate specific aspects of seismic analysis and design and provide examples of various applications of the guidelines proven simplified methods and state of the art analysis procedures have been carefully selected and integrated in the guidelines in order to provide a flexible and consistent methodology for the seismic design of port facilities

this comprehensive compendium highlights the practical side in the design of the coastal rubble mound structures all basic rubble mound structural elements with various special features or arrangements are discussed and presented with guidelines to the best practices a unique feature of this book offers insight into practical constraints and problems a variety of practical designs and construction examples are elucidated to most common issues faced in the design with extensive discussions on what influences the selection of the proper solution it is an essential aid to take the design a step further from basic to a professional level this useful reference benefits coastal engineers in general design consultants construction engineers or anyone carrying out supervision and inspection work related link s

trends in the analysis and design of marine structures is a collection of the papers presented at marstruct 2019 the 7th international conference on marine structures held in dubrovnik croatia 6 8 may 2019 the marstruct series of conferences started in glasgow uk in 2007 the second event of the series having taken place in lisbon portugal in march 2009 the third in hamburg germany in march 2011 the fourth in espoo finland in march 2013 the fifth in southampton uk in march 2015 and the sixth in lisbon portugal in may 2017 this conference series specialises in dealing with ships and offshore structures addressing topics in the fields of methods and tools for loads and load effects methods and tools for strength assessment experimental analysis of structures materials and fabrication of structures methods and tools for structural design and optimisation structural reliability safety and environmental protection trends in the analysis and design of marine structures is an essential document for academics engineers and all professionals involved in the area of analysis and design of ships and offshore structures about the series the proceedings in marine technology and ocean engineering series is devoted to the publication of proceedings of peer reviewed international conferences dealing with various aspects of marine technology and ocean engineering the series includes the proceedings of the following conferences the international maritime association of the mediterranean imam conferences the marine structures marstruct conferences the renewable energies offshore renew conferences and the maritime technology martech conferences the marine technology and ocean engineering series is also open to new conferences that cover topics on the sustainable exploration and exploitation of marine resources in various fields such as maritime transport and ports usage of the ocean including coastal areas nautical activities the exploration and exploitation of mineral resources the protection of the marine environment and its resources and risk analysis safety and reliability the aim of the series is to stimulate advanced education and training through the wide dissemination of the results of scientific research

in the last few years the quantity of books and papers on the political economic and legal problems of the exploration and use of the sea and marine resources has considerably increased but the status and activities of intern a tional organizations related to maritime shipping fisheries scientific research in the world ocean and the protection of the marine environment have not yet as a whole been represented in the scientific and reference literature it would be fair though to mention that some general information on marine international organizations may be found in the yearbook of international organizations brussels 1979 in annotated acronyms and abbreviations of marine science related international organizations u s department of commerce 1976 and in the un annotated directory ofinternational organizations concerned with ocean affairs 1976 voluminous informa tion on organizations engaged in problems of the exploration and use ofthe sea is given in international marine organizations by the well known polish scientists lopuski and symonides 1978 meanwhile the increasing volume of practical work related to the participa tion of governmental and scientific bodies as well as individual scientists and specialists in these organizations the necessity of long term planning in this field and the perspectives of the

development of these organizations make necessary a special publication depicting the structure and many sided activities of such international bodies this book is the first one in which the most complete information on the main marine international organizations is presented

this publication is a summary of good practice on the use of rock in engineering works for rivers coasts and seas it has incorporated all the significant advances in knowledge that have occurred over the past 10 15 years

displacement based seismic design of structures is a book primarily directed towards practicing structural designers who are interested in applying performance based concepts to seismic design since much of the material presented in the book has not been published elsewhere it will also be of considerable interest to researchers and to graduate and upper level undergraduate students of earthquake engineering who wish to develop a deeper understanding of how design can be used to control seismic response the design philosophy is based on determination of the optimum structural strength to achieve a given performance limit state related to a defined level of damage under a specified level of seismic intensity emphasis is also placed on how this strength is distributed through the structure this takes two forms methods of structural analysis and capacity design it is shown that equilibrium considerations frequently lead to a more advantageous distribution of strength than that resulting from stiffness considerations capacity design considerations have been reexamined and new and more realistic design approaches are presented to insure against undesirable modes of inelastic deformation the book considers a wide range of structural types including separate chapters on frame buildings wall buildings dual wall frame buildings masonry buildings timber structures bridges structures with isolation or added damping devices and wharves these are preceded by introductory chapters discussing conceptual problems with current force based design seismic input for displacement based design fundamentals of direct displacement based design and analytical tools appropriate for displacement based design the final two chapters adapt the principles of displacement based seismic design to assessment of existing structures and present the previously developed design information in the form of a draft building code the text is illustrated by copious worked design examples 39 in all and analysis aids are provided in the form of a cd containing three computer programs covering moment curvature analysis cumbia linear element based inelastic time history analysis ruauumoko and a general fibre element dynamic analysis program seismostruct the design procedure developed in this book is based on a secant stiffness rather than initial stiffness representation of structural response using a level of damping equivalent to the combined effects of elastic and hysteretic damping the approach has been fully verified by extensive inelastic time history analyses which are extensively reported in the text the design method is extremely simple to apply and very successful in providing dependable and predictable seismic response authors bios m j n priestley nigel priestley is professor emeritus of the university of california san diego and co director of the centre of research and graduate studies in earthquake engineering and engineering seismology rose school istituto universitario di studi superiori iuss pavia italy he has published more than 450 papers mainly on earthquake engineering and received numerous awards for his research he holds honorary doctorates from eth zurich and cujo argentina he is co author of two previous seismic design books seismic design of concrete and masonry buildings and seismic design and retrofit of bridges that are considered standard texts on the subjects g m calvi michele calvi is professor of the university of pavia and director of the centre of research and graduate studies in earthquake engineering and engineering seismology rose school istituto universitario di studi superiori iuss of pavia he has published more than 200 papers and is co author of the book seismic design and retrofit of bridges

that is considered a standard text on the subject has been involved in important construction projects worldwide such as the rion bridge in greece and the upgrading of the bolu viaduct in turkey and is coordinating several international research projects m j kowalsky mervyn kowalsky is associate professor of structural engineering in the department of civil construction and environmental engineering at north carolina state university and a member of the faculty of the rose school his research which has largely focused on the seismic behaviour of structures has been supported by the national science foundation the north carolina and alaska departments of transportation and several industrial organizations he is a registered professional engineer in north carolina and an active member of several national and international committees on performance based seismic design

this indispensable handbook provides state of the art information and common sense guidelines covering the design construction modernization of port and harbor related marine structures the design procedures and guidelines address the complex problems and illustrate factors that should be considered and included in appropriate design scenarios
