fibromyalgia fms is a chronic pain syndrome of unknown origin that lacks standardized treatment however participation in physical activity pa benefits people with fms despite the psychosocial and health benefits that can be gained through pa the correlates of pa among people with fms remain poorly understood further long term data on their pa are lacking the purpose of the present study was to identify and compare the effects of possible correlates of pa among women with fms as well as to examine long term pa trends with the goal of enhancing interventions

designed to promote pa in this population the potential correlates were suggested by social cognitive theory and the transtheoretical model and have been associated with pa in the general population it was hypothesized that self efficacy for pa would be the strongest discriminator among differing levels of pa that longitudinal changes in self efficacy would be significantly associated with changes in pa and that women with fms who maintained regular pa would be less impacted by their fms than those who had recently adopted or relapsed from pa or those who were sedentary participants were 187 female members of a health maintenance organization who were diagnosed with fms and had participated in an intervention designed to promote health and well being data were collected using measures from the project grad san diego health and exercise survey longitudinal data collected during the intervention study were used as well the results indicated that self efficacy and the behavioral processes of change were the strongest discriminators among pa adopters maintainers quitters and those who were sedentary enjoyment of pa barriers to pa impact of fms and the environment also discriminated among these groups contrary to expectations longitudinal changes in self efficacy were not significantly associated with changes in pa nor were those who maintained pa less impacted by their fms rather all groups demonstrated improvements these findings extend the sizable literature examining correlates of pa to women who suffer from fms while offering insight into long term patterns and outcomes of their pa implications of these findings and recommendations for future research are discussed
