areas as crystallization and dendrite growth the dynamo effect efficient simulation of biomolecules fluid dynamics and reacting flows mechanical problems involving friction population biology the spread of infectious diseases and quantum chaos the surveys in the book are addressed to experts and non experts in the mathematical community alike in addition they intend to convey the significance of the results for applications fair into the neighboring disciplines of science

for masters and phd students in economicsin this textbook the duality between the equilibrium concept used in dynamic economic theory and the stationarity of economic variables is explained and used in the presentation of single equations models and system of equations such as vars recursive models and simultaneous equations models the book also contains chapters on exogeneity in the context of estimation policy analysis and forecasting automatic computer based variable selection and how it can aid in the specification of an empirical macroeconomic model and finally on a common framework for model based economic forecasting supplementary materials and notes are available on the publisher s website

this volume centers on the links between mathematics and the physical world it first explores future challenges of mathematical technology offers a wide ranging definition of industrial mathematics and explains the mathematics of type ii superconductors after lucid discussions on theoretical and applied aspects of wavelets the book presents classical and fractal methods for physical problems including a fractal approach to porous media textures and using matlab to model chaos in the motion of a satellite the final section surveys recent trends in variational methods focusing on areas such as elliptic inverse problems sweeping processes and the bbky hierarchy of quantum kinetic equations

this and its companion volumes 2 and 3 document the proceedings of the 4th international symposium on surfactants in solution held in lund sweden june 27 july 2 1982 this biennial event was christened as the 4th symposium as this was a continuation of earlier conferences dealing with surfactants held in 1976 albany under the title micellization solubilization and microemulsions in 1978 knoxville under the title solution chemistry of surfactants and in 1980 potsdam where it was dubbed as solution behavior of surfactants theoretical and applied aspects the proceedings of all these symposia have been properly chronicled the lund symposium was believed as surfactants in solution as both the aggregation and adsorption aspects of surfactants were covered and furthermore we were interested in a general title which could be used for future conferences in this series as these biennial events have become a well recognized forum for bringing together researchers with varied interests in the arena of surfactants so it is amply vindicated to continue these and the next meeting is planned for july 9 13 1984 in bordeaux france under the cochairmanship of k l mittal and p bothorel the venue for 1986 is still open although india inter alia is a good possibility apropos we would be delighted to entertain suggestions regarding where and when these biennial symposia should be held in the future and you may direct your response to kk

topological tools in nonlinear analysis had a tremendous development during the last few decades the three main streams of research in this field topological degree singularity theory and variational methods have lately become impetuous rivers of scientific investigation the process is still going on and the achievements in this area are spectacular a most promising and rapidly developing field of research is the study of the role that symmetries play in nonlinear problems symmetries appear in a quite natural way in many problems in physics and in differential or symplectic geometry such as closed orbits for autonomous hamiltonian systems configurations of symmetric elastic plates under pressure hopf bifurcation taylor vortices convective motions of fluids oscillations of chemical reactions etc some of these problems have been tackled recently by different techniques using equivariant versions of degree singularity and variations the main purpose of the present volume is to give a survey of some of the most significant achievements obtained by topological methods in nonlinear analysis during the last two three decades the survey articles presented here reflect the personal taste and points of view of the authors all of them well known and distinguished specialists in their own fields on the subject matter a common feature of these papers is that of starting with an historical introductory background of the different disciplines under consideration and climbing up to the heights of the most recent results
