this book covers all principal aspects of currently investigated frustrated systems from exactly solved frustrated models to real experimental frustrated systems going through renormalization group treatment monte carlo investigation of frustrated classical ising and vector spin models low dimensional systems spin ice and quantum spin glass the reader can within a single book obtain a global view of the current research development in the field of frustrated systems this new edition is updated with recent theoretical numerical and experimental developments in the field of frustrated spin systems the first edition of the book appeared in 2005 in this edition more recent works until 2012 are reviewed it contains nine chapters written by researchers who have actively contributed to the field many results are from recent works of the authors the book is intended for postgraduate students as well as researchers in statistical physics magnetism materials science and various domains where real systems can be described with the spin language explicit demonstrations of formulas and full arguments leading to important results are given where it is possible to do so

i proms 2005 is an online web based conference it provides a platform for presenting discussing and disseminating research results contributed by scientists and industrial practitioners active in the area of intelligent systems and soft computing techniques such as fuzzy logic neural networks evolutionary algorithms and knowledge based systems and their application in different areas of manufacturing comprised of 100 peer reviewed articles this important resource provides tools to help enterprises achieve goals critical to the future of manufacturing i proms is an european union funded network that involves 30 partner organizations and more than 130 researchers from universities research organizations and corporations state of the art research results leading european researchers and industrial practitioners comprehensive collection of indexed and peer reviewed articles in book format supported by a user friendly full text cd rom with search functionality

the study of attractors of dynamical systems occupies an important position in the modern qualitative theory of differential equations this engaging volume presents an authoritative overview of both autonomous and non autonomous dynamical systems including the global compact attractor from an in depth introduction to the different types of dissipativity and attraction the book takes a comprehensive look at the connections between them and critically discusses applications of general results to different classes of differential equations the new chapters 15 17 added to this edition include some results concerning control dynamical systems the global attractors asymptotic stability of switched systems absolute asymptotic stability of differential difference equations and inclusions published in the works of author in recent years

an elementary introduction to polynomial continuation

this is the second volume of my book notes and problems in number theory we focus in this volume on the type of problems that develop the basic and most essential skills which are required for dealing with number theory problems we introduced some new topics in the first chapter i e introduction while the remaining chapters are largely dedicated to solved problems from the main topics of elementary number theory which are introduced in v1 or in the introduction chapter of the present volume we also introduced the subject of cryptography and computing in number theory in the last two chapters so in brief the materials in this volume are largely a mix of applications to the materials of v1 and some theoretical background of new topics as well as applications to the new topics as in my previous books my topmost priority in the structure and presentation is clarity and graduality so that the readers have the best chance of understanding the content with minimum effort and with maximum enjoyment

the book can be used as a text or as a reference for an introductory course on number theory and may also be used for general reading in mathematics especially by those who have the hobby of problem solving the book may also be adopted as a source of pedagogical materials which can supplement for instance tutorial sessions e g in undergraduate courses on mathematics or computing or cryptography or related subjects

this book covers selected topics in geometry algebra calculus and probability theory it contains the basic mathematical notions required by a first course in system theory for engineering and applied mathematics students it is the first book to provide a self contained and precise account of all the major mathematical methods and concepts relevant to the study of system theory

the first three chapters contain the elements of the theory of dynamical systems and the numerical solution of initial value problems in the remaining chapters numerical methods are formulated as dynamical systems and the convergence and stability properties of the methods are examined

this book covers linear and non linear systems with an emphasis on time domain methods and on topics related to computer aided system design and analysis the book contains a detailed discussion of discretization optimization and related numerical methods
