--- Technical Operation and Functionality

How Does the AM7890 DHW Work?

At its core, the AM7890 DHW functions as a simple on/off thermostat. It continuously monitors water temperature through its sensing element, comparing real-time readings against the user-set target temperature. When water temperature drops below the setpoint, the thermostat activates the heating element or boiler. Conversely, once the temperature reaches the desired level, it switches off the heating to prevent overheating.

Control Loop and Feedback Mechanism

The device operates through a straightforward control loop:

1. **Sensor Detection:** The embedded sensor detects the current water temperature.
2. **Comparison:** The thermostat compares this reading to the user-adjusted setpoint.
3. **Switching Action:** If the water is too cold, the thermostat closes its contacts to energize the heating device; if too hot, it opens the contacts to cut power.
4. **Maintaining Stability:** This cycle repeats to maintain a stable temperature.

range, with hysteresis settings preventing rapid cycling.
