this title presents an update of tm 1 88 it notes that the use of specialist hvac commissioning firms is now common in the uk and states that consensus opinion is that the commissioning specialists performance is sometimes below that purchased under their terms of engagement or subcontract the book considers that this state largely exists because the parties in a project do not understand their individual and collective responsibilities for hvac commissioning occurring at the various stages of a building project it also suggests that most projects where a hvac commissioning specialist is to be appointed would benefit from a clear understanding of the division of responsibilities sections include commissioning reporting activities and the commissioning specialist also included is a division of responsibilities schedule for hvac works

the building industry accounts for about 25 percent of the us gross national product through the design construction operation and maintenance of commercial institutional and residential buildings the handbook of heating ventilation and air conditioning provides a current comprehensive review of the latest procedures and trends in the industry it combines practice and theory systems and control and modern methods and technologies to provide in one volume all of the design and operation information needed by hvac engineers through a link on the crc site owners of the handbook can access new material periodically posted by the author

the performance of the hvac systems in buildings tends to decrease after few years of operation equipment and sensors degradation lead to remarkable wastes of energy and money as well as to the increase of building occupants thermal discomfort hvac ongoing commissioning ocx the continuation of hvac commissioning well into the occupancy and operation phase of a building life has been recognized as a cost effective strategy to reduce energy wastes equipment degradation and thermal discomfort building automation systems bas collect and store huge amount of data for the purpose of building systems control those data represent a golden mine of information that can be used for the ocx of the building hvac systems this research work develops and validates new methods and models to be used for the ocx of hvac systems using bas measurements from commonly installed sensors a fault detection and identification fd i method for chillers operation and several virtual sensor models for variables of interest in air handling units ahus are presented a fd i method based on principal components analysis pca has been developed and used to detect abnormal operation conditions in an existing chiller operation and identify the responsible variables the proposed fd i method has been trained using measurements from summer 2009 and then used to detect abnormal observations from the following seven summer seasons 2010 2016 when the detected abnormal observations were replaced with artificially generated fault free data the proposed fd i method did not detect any abnormal value along those artificially faulty free variables in summer 2016 the building operators changed several hvac system operation set points the fd i method was effective in detecting almost 100 of the observations and properly identifying those variables whose set point was changed for two different operation modes of an ahu several virtual outdoor air flow meters have been developed and the predictions have been compared against short term measurements using uncertainty analysis and statistical indices three models have been investigated when the heat recovery coil was off results showed that the model with the simplest mathematical formulation was the most accurate with the lowest value of uncertainty when a heat recovery coil at the fresh air intake was on two virtual flow meters have been developed to predict the outdoor air flow rate without the need of additional sensors both the

models predicted the outdoor air ratio with good statistical indices the mean absolute error mae was 0.015 for model a and 0.016 for model b three methods for the virtual measurement and or calibration of air temperature and relative humidity have been developed for different ahu operation modes these methods are different in terms of modelling strategy information needed and technical knowledge required for implementation for instance results from the correction of the faulty measurements of the outdoor air temperature along a 24 hours period using method a showed a high virtual calibration capability mae 0.2 °C and the coefficient of variation cv rmse 1.7 a new definition of virtual sensor is proposed at the end of this research work from a review of publications on virtual sensors for building application the two most recurrent reason for the implementation of virtual sensor models costs and practical issues have been highlighted and integrated into the proposed new definition
