what is meiosis it is a specialized form of cell division process in which a single cell divided twice to form four daughter cells that possess exactly half the number of chromosomes of the parent cell

meiosis vs mitosis cells are the building blocks of life whether it is a single cell organism or a multicellular one but to keep life going cells must multiply to heal or reproduce the two main ways

during meiosis ii the genetic content is already reduced to half so here the division is similar to mitosis where the sister chromatids separate during anaphase keeping the amount of genetic material intact

meiosis is called reductional division because number of chromosomes and amount of dna in daughter cells is reduced to half than that of parent cell in meiosis diploid number of chromosomes is reduced

during anaphase i stage of meiosis the cell starts to lengthen the two homologs of each chromosome pair separate and move toward opposite poles drawn by the microtubules of the spindle apparatus

meiosis is a reduction division where the number of chromosomes in the daughter cells is reduced to half as compared to the parent cell this set of chromosomes is called a haploid set or genome

meiosis is a reduction division because the end result of this special type of cell division is four haploid cells the first meiotic division occurs which results in two cells each with 46 chromosomes then

meiosis also produces genetic variation by way of the process of recombination during prophase of meiosis i the double chromatid homologous pairs of chromosomes cross over with each other and

during anaphase i the homologous chromosomes separate while the chromatids remain attached at their centromeres hence in anaphase i the chromosomes of each bivalent pair separate while the

meiosis results in formation of four daughter cells from a single parent cell and each of the daughter cell will have half of the genetic materials as of that in the parent cell
