the russian edition of this book appeared in 1976 on the hundred and fiftieth anniversary of the historic day of february 23 1826 when lobachevskii delivered his famous lecture on his discovery of non euclidean geometry the importance of the discovery of non euclidean geometry goes far beyond the limits of geometry itself it is safe to say that it was a turning point in the history of all mathematics the scientific revolution of the seventeenth century marked the transition from mathematics of constant magnitudes to mathematics of variable magnitudes during the seventies of the last century there occurred another scientific revolution by that time mathematicians had become familiar with the ideas of non euclidean geometry and the algebraic ideas of group and field all of which appeared at about the same time and the later ideas of set theory this gave rise to many geometries in addition to the euclidean geometry previously regarded as the only conceivable possibility to the arithmetics and algebras of many groups and fields in addition to the arithmetic and algebra of real and complex numbers and finally to new mathematical systems i e sets furnished with various structures having no classical analogues thus in the 1870 s there began a new mathematical era usually called until the middle of the twentieth century the era of modern mathematics

this resource is devoted to finite and non euclidean geometric systems for secondary school teachers and students

in this book dr coolidge explains non euclidean geometry which consists of two geometries based on axioms closely related to those specifying euclidean geometry as euclidean geometry lies at the intersection of metric geometry and affine geometry non euclidean geometry arises when either the metric requirement is relaxed or the parallel postulate is replaced with an alternative one in the latter case one obtains hyperbolic geometry and elliptic geometry the traditional non euclidean geometries when the metric requirement is relaxed then there are affine planes associated with the planar algebras which give rise to kinematic geometries that have also been called non euclidean geometry the essential difference between the metric geometries is the nature of parallel lines euclid's fifth postulate the parallel postulate is equivalent to playfair's postulate which states that within a two dimensional plane for any given line  $l$  and a point  $a$  which is not on  $l$  there is exactly one line through  $a$  that does not intersect  $l$  in hyperbolic geometry by contrast there are infinitely many lines through  $a$  not intersecting  $l$  while in elliptic geometry any line through  $a$  intersects  $l$

another way to describe the differences between these geometries is to consider two straight lines indefinitely extended in a two dimensional plane that are both perpendicular to a third line in euclidean geometry the lines remain at a constant distance from each other meaning that a line drawn perpendicular to one line at any point will intersect the other line and the length of the line segment joining the points of intersection remains constant and are known as parallels in hyperbolic geometry they curve away from each other increasing in distance as one moves further from the points of intersection with the common perpendicular these lines are often called ultraparallels in elliptic geometry the lines curve toward each other and intersect
