the aim of this book is to incorporate marshallian ideas such as external increasing returns and monopolistic competitions into

the general equilibrium framework of walrasian tradition new chapters and sections have been added to this revised and expanded edition of general equilibrium analysis of production and increasing returns world scientific 2009 the new material includes a presentation of equilibrium existence and core equivalence theorems for an infinite horizon economy with a measure space of consumers these results are currently the focus of extensive studies by mathematical theorists and are obtained by an application of an advanced mathematical concept called saturated super atomless measure space the second major change is the inclusion of a simple toy model of a liberal society which implements the difference principle proposed by j rawls as a principle of distributive justice this new section opens up a possibility to connect theoretical economics and political philosophy thirdly the author presents the marginal cost pricing equilibrium and discusses welfare properties of the external increasing returns which also belong to marshall pigou tradition of the cambridge school finally a new mathematical appendix treats basics of singular homology theory although the fixed point theorem is originally a theorem of algebraic topology most economic students know its proof only in the context of the differentiable manifold theory presented by j milnor considering the significance of the fixed point theorem and its playing a key role in general equilibrium theory the purpose of this new appendix is to provide readers with the idea of a proof of brower s fixed point theorem from the right place this volume will be helpful for graduate students and researchers of mathematical economics game theory and microeconomics

people pursue their own interests whatever those interests might be some people have interests that are narrow and selfish while others have interests that are broad and altruistic the idea that people are self interested underpins all of economic analysis and raises two fundamental questions 1 how do people choose the actions they think will further their own interests 2 can the potentially conflicting interests of different people be made to mesh in some sort of socio economic equilibrium this book is devoted to a detailed study of the first question its companion volume economy wide microeconomics equilibrium optimality applications and tests makes a detailed study of the second question following some foundational remarks this book studies the arrow debreu theory of consumer choice that theory supposes people choose so as to maximize a complete continuous transitive and reflexive binary preference relation over a non empty and compact choice set the book then studies numerous refinements generalizations and extensions of each of these restrictions up to and including recent work on behavioral theories of choice and choice behaviour when preferences are intransitive incomplete discontinuous also considered is choice behaviour in environments that are not necessarily compact a study is also made of intertemporal choice and choice under uncertainty the study of arrow debreu choice theory and its extensions are presented from the primal dual and revealed preference points of view consumers are not the only agents in the economy as producers are present as well beginning with a study of the arrow debreu idea that producers choose from a convex production set so as to maximize profit the book considers extensions and generalizations of this framework particularly to non convex environments the study is presented from the primal and dual points of view the final chapter in the book provides a link to its companion volume the chapter indicates how the theories of consumer and producer choice studied here help inform answers of the second question posed above resources are available to instructors who adopt this book more details at worldscientific.com/worldscibooks/10114212789 sm

to write everything about nothing or to write nothing about everything this is the problem anonym circa 1996 97 the first idea to write a book on mathematical economics more or less ordered in a historical sequence occurred to me in 1995 when i was asked by istituto delta enciclopedia italiana to write the entry storia dell economia 1 2 matematica for the collective work storia dei xx secolo i thought that it would be interesting to elaborate on the text presented to the editors to turn it into a book aiming at giving a panorama of what in my opinion are the main 20th century contributions to mathematical economics of course only a narrow set of the contributions made by economic theorists could be included both for space limitations and necessity because 3 of the limited competence of any single author for instance i have paid very limited attention to what is now called macroeconomics and also to game theory which actually has grown so much as to acquire scientific independence as a living branch of applied mathematics for the same reason i have also left completely untouched such fields as mathematical finance

public economics theory of taxation etc i have always based my presentation on published material only assuming that what is contained in working papers still waits to be confirmed possibly in the first years of the 21th century

the series is designed to bring together those mathematicians who are seriously interested in getting new challenging stimuli from economic theories with those economists who are seeking effective mathematical tools for their research a lot of economic problems can be formulated as constrained optimizations and equilibration of their solutions various mathematical theories have been supplying economists with indispensable machineries for these problems arising in economic theory conversely mathematicians have been stimulated by various mathematical difficulties raised by economic theories

economic methodology has traditionally been associated with logical positivism in the vein of milton friedman karl popper imre lakatos and thomas kuhn however the emergence and proliferation of new research programs in economics have stimulated many novel developments in economic methodology this impressive companion critically examines these advances in methodological thinking particularly those that are associated with the new research programs which challenge standard economic methodology bringing together a collection of leading contributors to this new methodological thinking the authors explain how it differs from the past and point towards further concerns and future issues the recent research programs explored include behavioral and experimental economics neuroeconomics new welfare theory happiness and subjective well being research geographical economics complexity and computational economics agent based modeling evolutionary thinking macroeconomics and keynesianism after the crisis and new thinking about the status of the economics profession and the role of the media in economics this important compendium will prove invaluable for researchers and postgraduate students of economic methodology and the philosophy of economics practitioners in the vanguard of new economic thinking will also find plenty of useful information in this path breaking book
