while the standard sophomore course on elementary differential equations is typically one semester in length most of the texts currently being used for these courses have evolved into calculus like presentations that include a large collection of methods and applications packaged with state of the art color graphics student solution manuals the latest fonts marginal notes and web based supplements all of this adds up to several hundred pages of text and can be very expensive many students do not have the time or desire to read voluminous texts and explore internet supplements that's what makes the format of this differential equations book unique it is a one semester brief treatment of the basic ideas models and solution methods its limited coverage places it somewhere between an outline and a detailed textbook the author writes concisely to the point and in plain language many worked examples and exercises are included a student who works through this primer will have the tools to go to the next level in applying odes to problems in engineering science and applied mathematics it will also give instructors who want more concise coverage an alternative to existing texts this text also encourages students to use a computer algebra system to solve problems numerically it can be stated with certainty that the numerical solution of differential equations is a central activity in science and engineering and it is absolutely necessary to teach students scientific computation as early as possible templates of matlab programs that solve differential equations are given in an appendix maple and mathematica commands are given as well the author taught this material on several occasions to students who have had a standard three semester calculus sequence it has been well received by many students who appreciated having a small definitive parcel of material to learn moreover this text gives students the opportunity to start reading mathematics at a slightly higher level than experienced in pre calculus and calculus not every small detail is included therefore the book can be a bridge in their progress to study more advanced material at the junior senior level where books leave a lot to the reader and are not packaged with elementary formats j david logan is professor of mathematics at the university of nebraska lincoln he is the author of another recent undergraduate textbook applied partial differential equations 2nd edition springer 2004

divided into two parts this book provides an introduction to matlab with the idea that the reader will learn the program by trying the commands described in the text and by further experimenting with them the second part of the book covers applications to specific engineering fields strength analysis machine design vibrations signal processing and control engineering and demonstrates how matlab can solve engineering problems in these areas

master numerical methods using matlab today's leading software for problem solving this complete guide to numerical methods in chemical engineering is the first to take full advantage of matlab's powerful calculation environment every chapter contains several examples using general matlab functions that implement the method and can also be applied to many other problems in the same category the authors begin by introducing the solution of nonlinear equations using several standard approaches including methods of successive substitution and linear interpolation the wegstien method the newton raphson method the eigenvalue method and synthetic division algorithms with these fundamentals in hand they move on to simultaneous linear algebraic equations covering matrix and vector operations cramer's rule gauss methods the jacobi method and the characteristic value problem additional coverage includes finite difference methods and interpolation of equally and unequally spaced points numerical differentiation and integration including differentiation by backward forward and central finite differences newton cotes formulas and the gauss quadrature two detailed chapters on ordinary and partial differential equations linear and nonlinear regression analyses including least squares estimated vector of parameters method of steepest descent gauss newton method marquardt method newton method and multiple nonlinear regression the numerical methods covered here represent virtually all of those commonly used by practicing chemical engineers the focus on matlab enables readers to accomplish more with less complexity than was possible with traditional fortran for those unfamiliar with matlab a brief introduction is provided as an appendix over 60 matlab examples methods and function scripts are covered and all of them are included on the book's cd
